Previous Vaccinations: Influenza vaccine containing eggs

Other Medications: Amlodipine 2.5 mg daily Hydrochlorothiazide 37.5 mg daily Losartan 50 mg bid Metoprolol 50 mg daily Albuterol inhaler as needed

Current Illness: None

Preexisting Conditions: Hypertension h/o LTBI (treated)

Allergies: Chicken, reaction throat tightness Chocolate, throat tightness Egg, throat tightness Shellfish, rash and throat tightness

Diagnostic Lab Data:

CDC Split Type:

Write-up: 40 year female received Pfizer-BioNTech COVID-19 Vaccine today Patient reported prior h/o severe allergic reaction to influenza vaccine with eggs preservative. She has received flu vaccine w/o egg w/o problem. Due to her prior history of severe allergic reaction/ anaphylaxis to another vaccine, in this case flu vaccine with eggs, we should proceed with caution. She was told we could defer vaccination until more information becomes available. She opted to proceed with receiving Pfizer-BioNTech COVID-19 Vaccine and be observed for 30 minute observation period. Patient developed throat tightening approximately 20 minutes after vaccination. She received EpiPen within 1 minute of symptoms and was sent to ER immediately in wheelchair by nursing staff. Patient was evaluated in ED and was hemodynamically stable. She was given IV benadryl and was stable throughout observation

Previous Vaccinations: Rabies vaccine

Other Medications: Atorvastatin 20 mg once daily

Current Illness: None

Preexisting Conditions: Severe allergies

Allergies: Fish Iodine Shellfish Rabies vaccine

Diagnostic Lab Data: NA

CDC Split Type:

Write-up: 5 minutes after the Pfizer Covid-19 vaccine administration, the patient developed flushing, hives, felt warm and eventually short of breath. She started to wheeze and was wheeled into ER c/o "I can't breathe while holding throat and thrashing with facial flushness noted. PT took 2 Benadryls and had several Epi shots. She was then discharged from the ER and later on that day, started to feel short of breath again. In the ED today she was audibly gasping for air, however had no wheezing, had a normal saturation and a normal blood pressure. She had taken another dose of her EpiPen IM and diphenhydramine 50 mg by mouth prior to coming. She was then admitted to the hospital for further observation. While on the floor, she started to feel short of breath again (about 9 am on 12/18/2020), which required an RRT . Patient received another dose of diphenhydramine IV, methylprednisolone 125 mg IV and several doses of IM epinephrine. She also required oxygen. She was then transferred

to an ICU for further care.

Previous Vaccinations:

Other Medications: Topamax 50mg daily, Celexa 10mg daily, Imitrex 100mg PRN

Current Illness: None

Preexisting Conditions: Migraines

Allergies: PCN- unknown reaction, was just always just told was, but no history of a anaphylaxis and able to tolerate cephalosporins.

Diagnostic Lab Data: Cbc, cmp, rapid COVID PCR, Covid antibody, pregnancy test

CDC Split Type:

Write-up: 15 minutes after getting the vaccine began itching that quickly developed into rash/hives to face, neck, chest, abdomen. At 20 minutes post vaccine developed severe leg weakness with lightheadedness, chest tightness, and SOB. 22 minutes out collapsed to the floor unable to bear weight due to leg weakness and had severe cramping and tingling in legs, still unable to move them. Was rushed to the ER from employee health and arrived approximately 30 minutes post vaccine administration at that time there was significant mottling to arms and hands with polar nail beds. Vital signs were stable, no strider. Given Solumedrol, Benadryl, and Pepcid STAT. Rash/hives and SOB improved, but legs weakness/tingling, cramping did not and noted purple feet with cyanotic nail beds and mottling to hands/ arms that would come and go. Rash/hives reappeared much worse 2 hours post meds to face, neck, and upper chest. Was given another series of Solumedrol and Benadryl and admitted to the hospital. I am now 19 hours post vaccine with improved but persistent leg weakness, now able to bear my own weight independently and walk a few steps, but still having legs cramps and intermittent tingling to feet. Color has improved with resolved mottling/cyanosis. I continue to have hives reappear with scheduled Benadryl, Solumedrol, and Pepcid.

Other Medications: Symbicort, albuterol

Current Illness: Cervical radiculopathy with medrol dose pack on 11/24.

Preexisting Conditions: Asthma, migraines, Factor V Leiden, vitiligo, environmental/seasonal allergies

Allergies: Latex, Sulfa's, dairy products, gluten

Diagnostic Lab Data:

CDC Split Type:

Write-up: 12 minutes after injection, I felt flushed and dizzy. They hooked me up to a vital sign monitor which showed my heart increasing to 133 bpm, SaO2 98%. A manual blood pressure check was 168/110. My heart felt like it was pounding, I was hot and sweating. After 10 minutes or so, I felt increasingly dizzy and my vision started fading. VS still showed tachycardia and hypertension. It became difficult to swallow and my tongue was feeling fat. A Rapid Response Team was alerted, they started an IV, and took me to the Emergency Department. I became very cold and shaky. My hands and feet became a little mottled. They gave me 50 mg IV benedryl, 20 mg IV pepcid, a dose of solumedrol, and IM epinephrine 0.3mg, and 1 Liter of fluid. My symptoms resolved and I was discharged home a couple hours later.

Current Illness: Enterococcus faecalis UTI diagnosed 11/25/20 associated with ureteral stent removal 11/10/20 treated successfully with Augmentin

Preexisting Conditions: Borderline HTN, recurrent renal calculi

Allergies: None

Diagnostic Lab Data: Presentation labs: WBC 21.6 Hct 38.9 Plt 227 K 3.3 Cr 1.26 Lactate 2.6 Protein 6.5 Alb 3.5 AST/ALT/AP normal INR 1.4 PTT 48.1 Procalcitonin 4.7 CXR: Mild congestion Cultures Blod, urins (1day): NGTD

CDC Split Type:

Write-up: The patient was well prior to vaccination (12/17). The day after, he felt mildly unwell and had a low grade fever. The following day, he had a fever of 102. He received 1L of fluid at Urgent Care and had a BP in the 80s. Shortly thereafter, he felt palpitations and developed AF. He came to the hospital where he was tachycardia to 200 bpm and hypotensive to SBP70s. He received aggressive fluid resuscitation (4L), IV metoprolol and was started on empiric Abx. Within several hours, the HR lowered, BP increased, and AF spontaneously converted to sinus. He had no dysuria. Cultures so far have not shown growth at our hospital. Urinary culture from urgent care has reportedly shows 20k gram positive cocci.

Previous Vaccinations:

Other Medications: Singulair, advair, Duonebs, dupixent, albuterol, zyrtec, chlorpheniramine; wellbutrin, Sertraline;

Current Illness: had been feeling slightly under the weather two weeks ago; no current asthma exacerbation, but has very labile asthma

Preexisting Conditions: Sleep apnea on CPAP eosinophilic asthma on multiple controller meds environmental allergies obesity

Allergies: Anaphylaxis hx to NSAIDS; hs of environmental allergies, and reaction to latex

Diagnostic Lab Data: 12/22/20 - CXR ordered - results not currently available

CDC Split Type:

Write-up: patient felt slightly nauseated at 10 minutes after injection, then developed slight sweating; BP 160/81; 83 at 5:45 and then 158/87 with HR 82 at 5: 52 pm. Her lungs were clear, she was speaking in full sentences and was denying any chest pressure, her usual

sense of asthma exacerbation. At 6:05 it was 164/83 with HR 79 and patient developed a dry cough; we decided to have her wait just a bit longer, then cough worsened, so at 6:25, decision was made to have patient seen in ER for further assessment, and en route in wheelchair to ER the dry cough became persistent, spasmodic and patient was unable to speak. Epi-Pen was injected in right mid thigh, and patient transported to ED urgent eval. She noted immediate palpitations, and slight improvement of breathing, was able to speak in four word sentences. On arrival to the ED, patient was administered Duonebs, Albuterol neb, IV Benedryl, IV Solumedrol; CXR was obtained, with results pending. Patient was sent to observation for ongoing monitoring and assessment of breathing. at 6:30 PM in the ER, she

Other Medications: None

Current Illness: Tested positive for Covid-19 on 11/14/2020

Preexisting Conditions: None

Allergies: Hepatitis B vaccine - hives Latex - rash Sulfa drugs - hives

Diagnostic Lab Data: EKG sinus tachycardia (12/24/20) No other tests or labs performed

CDC Split Type:

Write-up: Approximately 2 minutes after injection, felt flushed and tingly. This subsided, but developed a cough. Felt fine enough to leave the vaccination area after being monitored for 15 minutes. Cough continued, and developed a scratchy throat that eventually led to swelling of the throat at approximately 30-35 mins post administration. Sought care in the ED, where I was tachycardic and hypertensive. Received IV Benadryl, steroids, and IV fluids. Discharged home, but symptoms returned around 2pm. Sought care in a different ED, where I remained hypertensive and tachycardic. Received additional IV fluids, IV Benadryl and steroids. Eventually was treated with IM epinephrine after my heart rate was decreased to about 100bpm with IV metoprolol.

Current Illness:

Preexisting Conditions: Medical History/Concurrent Conditions: Allergy; Asthma; Blood cholesterol abnormal; Blood pressure high; Diabetes; Post procedural pain; Reflux gastritis; Rosacea; Sciatica; Shingles; Sinus congestion; Swelling

Allergies:

Diagnostic Lab Data:

CDC Split Type: USPFIZER INC2020508893

Write-up: she is better but still not good; not to be able to breath; sore right arm; This is a spontaneous report from a contactable nurse (patient herself). A 62-year-old female patient received bnt162b2 (BNT162B2, lot EK5730), intramuscular on 18Dec2020 at single dose for immunisation. Medical history included asthma (hospitalized on Jan2020 and has not had any issues since that time, referring to her asthma) diabetes, high blood pressure, swelling,

sciatica, blood cholesterol abnormal, rosacea, reflux, allergies, sinus congestion, shingles and post carpal tunnel surgery. Concomitant medications included lisinopril, hydrochlorothiazide, gabapentin, rosuvastatin, metformin, glipizide, doxycycline, sucralfate, cetirizine hydrochloride (ZYRTEC), pseudoephedrine, ascorbic acid, ergocalciferol, nicotinamide, retinol, riboflavin, thiamine hydrochloride (VITAMINS) and tramadol. The patient reported that she not to be able to breath (seriousness criteria-life threatening) on 22Dec2020. She woke up this morning and could not breathe and there was no reason for her to not be able to breath. She thought she may have had a reaction to the COVID vaccine. It was the only thing she could think of that might have caused her not to be able to breathe this morning. As treatment for not to be able to breath, she used Budesonide and Levosalbutamol in her nebulizer. She had sore right arm on 18Dec2020. She informed that she had done everything she can and she was better but still not good. She planned to take the second dose of the COVID Vaccine because she thought it was more important to be protected. She suspected that the vaccine was related to the events sore right arm and could not breathe. The outcome of the event not to be able to breath was recovering; for sore right arm was recovered on unknown date in Dec2020; for she is better but still not good was unknown.; Sender's Comments: Severe allergic reaction including anaphylaxis is the known risk factor; a possible causal association between administration of BNT162B2 and the onset of not being able to breath cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Previous Vaccinations:

Other Medications: unknown

Current Illness: denied

Preexisting Conditions: unknown

Allergies: denied hx of allergy or anaphylaxis

Diagnostic Lab Data: Pulse was measured at 170-180 range, very regular, no EKG machine was available so an SVT was considered possibly triggered by stress as another staff member was developing anaphylaxis near by. Pt. was calm and denied anxiety except with regard to her palpitations and mid sternal burning. O2 sat was 100% on room air, no respiratory, cutaneous or G.I. symptoms at the time of onset. Since pulse and symptoms did not diminish over the next 15 minutes we transported her to our E.R. where she subsequently also underwent treatment for anaphylaxis with Epinephrine, benedryl, steroids and multiple liters of fluid to which she responded and stabilized.

CDC Split Type:

Write-up: Pt. began to feel weak with palpitations about 8-10 minutes after vaccination, her pulse was extremely fast, she then began to complain of lower mid-esophageal burning

Previous Vaccinations:

Other Medications: Amlodipine 10 mg daily

Current Illness: none

Preexisting Conditions: Hypertension

Allergies: No known allergies

Diagnostic Lab Data: EKGs, Chest X-rays, Serial Troponin Levels, CBC, CMP, Cardiac Stress test

CDC Split Type:

Write-up: On Dec. 20, 2020 around 11:30 PM, 2 days after patient received her COVID-19 vaccination, she was found on the bathroom floor, obtunded, very pale, diaphoretic, nauseous, and complaining of severe chest pain. Paramedics was called and patient was

transported to the nearest emergency room. According to paramedics, on the way to the ER while patient was in the ambulance, she was noted with a sudden drop in heart rate about 19 beats/minute and have to be given Atropine IV Push, oxygen and was connected to transcutaneous pacing which improves her heart rate. In the ER patient continued to have chest pain and she was given Morphine, Oxygen, Nitroglycerine and Aspirin. IM had an EKG which showed Sinus Bradycardia with a Right Bundle Branch Block. She had serial ekgs, a chest x-ray, laboratory testing which included Troponin. Her first Troponin level came back elevated prompting her hospital admission to Telemetry. Her next 2 Troponin level improved and return to normal range and her chest pain has resolved.. She underwent a Stress Test which came back negative. Patient was admitted for a total of 20 hours in the Telemetry unit with Cardiology consultation before being discharged home last . She was re-evaluated by the cardiologist yesterday which diagnosed her a chest pain of unknown origin.

Current Illness:

Preexisting Conditions: Macular degeneration HTN

Allergies: Previous experienced three episodes of angioedema. One episode was thought to be from losartan. Patient experienced 2 additional episodes while off losartan. Previously diagnosed with seasonal allergies. Patient stated all three episodes he had eaten some sort of salad/vegetable and thinks this could be related to environmental allergies.

Diagnostic Lab Data: CMP and CBC were unremarkable 12/30 COVID-19 PCR was negative 12/30

CDC Split Type:

Write-up: Patient stated he stopped his blood pressure medications 3 days prior to vaccination due to a previous reaction to losartan, a medication he was no longer taking. Patient took aspirin and a MVI on day of vaccination and drank lemon water. Patient developed tingling sensation in his mouth after eating dinner around 18:00. Patient stated he ate tacos with apple cider and noticed tingling after dinner. Patient stated he took two benadryl with no relief. His tongue continued to swell and he took two additional benadryl at 22:00. Once he developed difficulty swallowing he went to the emergency department. Patient presented to the ED with tongue swelling and difficulty swallowing. At 23:57 he was administered 0.3mg of epinephrine IM, diphenhydramine 25mg IV, famotidine 40mg IV, dexamethasone 10mg IV at 0114, methylprednisolone 60mg q6hrs started at 0417, diphenhydramine 25mg q6hrs IV started at 0416, albuterol 2.5mg via neb q6hrs started at 0710

Other Medications: Vitamin D3, omega-3, Vitamin A/C, psyllium

Current Illness: none

Preexisting Conditions: History of Renal Cell Carcinoma s/p nephrectomy, Hyperlipidemia, osteopenia, sinus bradycardia, cervical radiculopathy

Allergies: None

Diagnostic Lab Data: TTE 12/30: EF 35%. Regional variation with normal contraction at the base and hypokinesia of the mid and distal segments with perhaps some sparing of the apex. Pattern is consistent with Takotsubo cardiomyopathy. Cardiac Catheterization 12/30: Mild Coronary Disease in LAD. Otherwise minimal CAD. Mildly elevated left sided filling pressure. ESR: 24 CRP <5 WBC 6.46, H/H 13.7/39.7

CDC Split Type:

Write-up: Patient started having myalgia, chills, nausea on the next day of the vaccination. on 2nd day (12/29) patient had chest pressure which made her present to Hospital ED. She had troponin elevation to 1.14. Cardiac Catheterization was done which was negative. On Trans Thoracic Echocardiogram, patient was found to have hypokinesia of the mid and distal segment with some sparing of apex proving Takotsubo (stress induced) cardiomyopathy. Patient did not have any underlying emotional or physical stress going on in her life or family. Till now extensive infectious as well as inflammatory work up is done to rule out any secondary causes of cardiomyopathy which till date have remained negative. As a diagnosis of exclusion, her presentation seems to be COVID-19 vaccine induced Takotsubo Cardiomyopathy

CDC Split Type:

Write-up: 15-20 mins after receiving the vaccine she reported she had difficulty swallowing and difficulty breathing and was "shaking." a PA wrote in her note that when she ran in to help, she found the patient to be tachypneic, diaphoretic, warm with some red blotchy patches on face, chest & neck. Able to speak easily c/o trouble breathing & sensation of throat swelling & extremities feeling abnormal. No stridor. No facial edema noted by that clinician. Administered epi-pen 0.3mg - IV started, Benadryl 50mg IVP and solumedrol 125mg IVP.

Patient reports she subsequently arched her back and had rigidity of her arms/legs and tremors. Clinic PA reports that while she was there, pt was never hypotensive. Initially hypertensive after epi as expected with some favorable response after 10-15 min Staff there gave her IM epinephrine, IV Solu-Medrol and 50 mg IV Benadryl. EMS was contacted and transported to the emergency room. She arrived at the ER, was monitored for 2 hours, was started on pepcid and benadryl and discharged from the ER. She had a diffuse itchy rash. The following day she again developed recurrence of throat swelling. Went back to a different ER. Developed dyspnea immediately prior to arrival at ER. There was again given solumedrol and benadryl and pepcid and developed muscle rigidity and arched back for 10 minutes. Symptoms of SOB and dyspnea resolved with epinephrine. Was discharged from the ER with prednisone after being monitored for 5 hours. Is continuing to take prednisone and benadryl. Rash is still present but improving with scheduled benadryl. Has new redness at injection site today. Continues to feel some throat swelling but no tightness today. This information was gathered from talking with pt today for a phone appt and also from her medical chart regarding her vaccination visit and two ER visits.

Current Illness: None

Preexisting Conditions: Undifferentiated connective tissue disorder, asthma, seasonal allergies, Raynaud's phenomenon, GERD, migraine

Allergies: peanuts, soy, oysters, crab/lobster, penicillin

Diagnostic Lab Data:

CDC Split Type:

Write-up: The vaccine was received at 1:12 PM, and I felt fairly fine, aside from injection site pain and some tingling in my left arm until I had sudden significant elevation of heart rate, with shortness of breath, and throat swelling/tightening at approximately 1:26PM. I cold compress was applied to my forehead and I was put in a reclining position & then received Epinephrine

at 1:28PM. EMS (present onsite) arrived for transport at 1:31PM. 4L of oxygen was applied after O2 sat of 89% noted by EMS. Blood pressure was elevated to \$g200/100 initially by EMS. Symptoms improved quickly following epinephrine, with some residual feelings of very mild throat fullness, and I developed chills which improved over time. I was transported to emergency department where I was evaluated (symptoms mostly resolved at that time, but ED physician noted a little swelling remaining in my uvula), then IV Benadryl and Decadron were given. Later acetaminophen was also given for headache that developed during my ED stay. My vitals were monitored throughout and observation occurred until I was discharged at approximately 5:00PM, as symptoms had not recurred.

Current Illness: NONE

Preexisting Conditions: ANXIETY DEPRESSION

Allergies: SHELLFISH SEAFOOD ALL OF THE PENICILLIN GROUP ANTIBIOTICS

Diagnostic Lab Data: Chest x-ray that was taken after all the I.V. medication was given was normal.

CDC Split Type:

Write-up: Anaphylaxis. The COVID shot was given, no reaction then. After 7 minutes, congestion, severe cough, vomiting phlegm, feeling like throat closing started happening. Code was called, Benadryl was immediately given intramuscular in the left arm, blood pressure, pulse ox was taken, and then was taken to the Emergency Department. In the ED, I was given prednisone, one EPI, anti-nausea medication all through I.V. and many more medications given to me via I.V. that I don't sincerely remember. I was under observation for 4 hours. I was discharged after all symptoms dissipated and was given Prednisone 20 MG (3 tabs a day) to take to help my lungs. Management followed up almost immediately, everyone from the moment I had the anaphylactic reaction was quick and prepared.

Write-up: 20 minutes after receiving the vaccination the resident started to not feel well. She said she felt very far away and just kept repeating I don't feel well. She was diaphoretic and her chest was very red and she kept scratching and rubbing it at it. I asked if she wanted IM Benadryl or epipen and she at first denied. She also said she felt like she needed to focus on her breathing. At this time we decided it was best to administer Epipen x 1 dose. Immediately after she felt better. She was observed for another 30 minutes and then went home. at 7:17pm I called and spoke with her. She said her arm was sore and that her oxygen levels were about 88-89% which is low for her but she said she felt fine and is currently working right now.

Diagnostic Lab Data: Test Date: 202012; Test Name: CT scan; Result Unstructured Data: Test Result:showed extensive infiltration in the lungs; Test Date: 20201218; Test Name: O2 saturation; Result Unstructured Data: Test Result:80%; Test Date: 20201226; Test Name: COVID test; Test Result: Positive

CDC Split Type: USPFIZER INC2020518143

Write-up: had a positive COVID test; had a positive COVID test; O2 Saturation of 80% / Hypoxia; shortness of breath; He has a CT scan which showed extensive infiltration in the lungs; muscle pain; chills; body aches; low grade fever; cough; This is a spontaneous report from a contactable physician (pulmonary medicine). This physician reported similar events for 2 patients. This is 1st of 2 reports. A 35-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 18Dec2020 at single dose for covid-19 immunization. There were no medical history and concomitant medications. Caller stated that his close friend who was ER physician (front line worker) and within 24 hours after receiving the COVID vaccine, developed COVID or symptoms of COVID. Patient received the COVID vaccine on 18Dec2020 and the same night patient started with a low grade fever, body aches, chills, muscle pain, shortness of breath, cough, O2 saturation of 80% (hypoxia) and was in the intensive care unit now. Patient swore this was related to the vaccine. This patient tested positive for COVID. He had a CT (computerised tomogram) scan which showed extensive infiltration in the lungs in Dec2020. Patient was admitted to the hospital on 24Dec2020 and then was moved to the ICU 2 days later, on 26Dec2020. Caller thought patient had a positive COVID test at another hospital. Caller did know that tested positive at the current hospital on 26Dec2020 which was done to confirm the previous positive test. Caller thought patient had his first positive COVID test either the same day or the next day after receiving the vaccine. Event of O2 Saturation of 80% / hypoxia was reported as hospitalization from 24Dec2020 and life threatening; infiltration in the lungs and shortness of breath caused hospitalization from 24Dec2020, muscle pain, chills and positive COVID test was reported as medically significant; and other events were reported as non-serious. Outcome of O2 saturation of 80% / hypoxia and shortness of breath was not recovered, outcome of cough was recovering; and outcome of other events were unknown. Information about lot/batch number has been requested. ; Sender"s Comments: Based on the information currently available, a lack of efficacy with suspected vaccine BNT162B2 in this patient cannot be completely excluded.,Linked Report(s) : US-PFIZER INC-2020519020 same reporter/drug , different patient/AE.

Previous Vaccinations:
Other Medications: unknown
Current Illness: No reported illness at time of vaccine, unknown for month prior
Preexisting Conditions: unknown other than client stated cardiac issues
Allergies: Bactrim, Augmentin , Cats
Diagnostic Lab Data: EMS checked client at scene. Vitals normal, EKG normal.
CDC Split Type:

Write-up: Client received vaccine at approximately 3:50pm, waited in observational area x30min. Left with husband, stated that she got a few miles down the road and starting experiencing tightness in her chest and flushing. She took 50 mg of Benadryl, 30mg of prednisone and two puffs on her inhaler. She returned to the clinic, upon assessment from nursing she looked extremely flushed and anxious, she stated that she still felt tightness and that she had a history of anaphylaxis once before and had used an epi pen in the past. She had an epi pen with her and questioned whether or not she should give it to herself. BP was 190/68, pulse was normal, respirations normal, she continued to experience tightness and "not able to catch my breath", encouraged to use epi pen. She administered epi pen to right thigh at approximately 4:45PM, 911 called. Within a few minutes, she stated she was feeling better, less tightness in the chest, flushing was subsiding. BP at 190/70 at 4:52. EMS on scene at 5:03pm. Vitals normal , EKG normal. Client decided not to transport with EMS.

Previous Vaccinations: swine flu vaccine 1978? was very sick and couldn't walk well

Other Medications: atenolol 25 mg per day, claritin 10 mg per day, evamist one spray per day, pepcid 20 mg per day, vit b12 3000 mcg per day, vit d 5000 units per day, prenatal gummy vitamin one per day, tylenol 500 mg per day, benadryl 50 mg per day

Current Illness: none

Preexisting Conditions: chronic gastritis, tachycardia, kidney stones. food allergies

Allergies: aspirin, NSAIDS, flexeril, percocet, thiomerosol in any product, caffeine or stimulants, allergic to milk, ?to eggs, ?to bluberries and strawberries, severe to cheese esp cheddar, ?to onions, ? to garlic, ?to grapes, severe intolerance to alcohol

Diagnostic Lab Data: none

CDC Split Type:

Write-up: 5 minutes after injection, my feet and palms itched and I was lightheaded but I tried to shake it off and it faded over the next 10 minutes. I did report it and stayed longer and was ok. Then i went straight home and layed down because i did not sleep well night before (was on call) i awoke 1 hour post injection dry heaving, very nauseated, mild headache, achy, itchy over different parts of my body and weak. Sat up and my face was getting itchier, lips started to swell, tongue started to swell and itch, throat felt like someone was strangling me, had trouble swallowing and trouble breathing. took 2 benadryls immediately and went out into cold air, thought about calling 911 but got better in 10-15 minutes. never have had a reaction like this in my life. have had hives though in the past. If I would have had an epi pen I would have used it (never have had an epi pen) I was frightened but the benadryl worked and I slept due to the benadryl for 5 hours, when I woke up the benadryl wore off and it started again. took more benadryl, and it improved. before bedtime, the benadryl wore off and I had a hard time swallowing my night time meds like my throat was swollen. Took 2 more benadryls, today I am weak and nauseated and ate very little and feel like my face is still red and itchy. I told my sister and she said she is allergic to PEG which i later noted was in the vaccine. i am very disappointed that I had this reaction- I have desparately wanted this vaccine as a medical worker with a lot of covid patients- I onlu hopr this one shot will protect me enough because it is clear to me that i cannot take this vaccine again.

Diagnostic Lab Data: Completed in the ED hospital and then transferred.

CDC Split Type:

Write-up: Resident had the COVID vaccine 12/30/2020. 12/31/20, resident has been in bed all shift. Staff became concerned when resident was not easily aroused. Resident displayed signs of tremors, twitching, confusion, in and out of consciousness, low O2 sats, elevated pulse and fever, fatigue and weakness. Writer called NP. NP stated this is most likely a reaction d/t the COVID vaccine. She gave orders for Benadryl 25mg IM x1 now and Tylenol

1000 mg now. NP also stated resident will not be getting the second dose of vaccine. Will continue to monitor and update NP if worsening symptoms. After receiving Benadryl and Tylenol at 145pm, resident began to appear as though she was feeling better and was talking to talk, fever had gone down. Tonight resident is not easily aroused, lethargic, continues to have tremors and twitches, almost appearing as convulsions. When asked if she knows where she is or what day it is, resident can properly answer. Resident denies SOB but staff has noted loud squeals while breathing. NP was updated and gave new orders to give Benadryl 25 mg IM x1 if needed and Ok to send resident to ED. Resident currently refuses to go to the hospital. Will continue to monitor. BP 152/112, P 116, T 99.1, O2 87-91. Resident's O2 at 1205am was 80% on 3LPM. Resident unable to be aroused from sleep by writer. NAR called to assist. NAR could not arouse resident. Writer and NAR attempted to reposition resident and resident's breathing became more labored. Resident turned back to previous position and writer called on call MD at approx. 1220am. MD returned call approx. 1235am with orders to send resident to ED. 911 called and ambulance arrived about 1245am. History of present condition given to EMTs and they stated resident would be going to Hospital. Writer has attempted to contact Hospital ED x3 but have been unable to get through. An EMT did just call to clarify when vaccine was given, what symptoms have been present and when they started. She said she has everything she should need and she will let Hospital ED staff know to call if they need anything else. Writer will again attempt to contact them though. Resident's temp was 97.5 and BG 128. When EMTs arrived they got an O2 reading of 60%. Resident did open her eyes a couple times during transfer from bed to stretcher and while stretcher was going outside but no responses from resident were made.

Other Medications: CETRIZINE; NORCO; ; ZOFRAN [ONDANSETRON]

Current Illness:

Preexisting Conditions: Medical History/Concurrent Conditions: House dust mite allergy

Allergies:

Diagnostic Lab Data: Test Name: skin testing; Result Unstructured Data: Test Result:allergy to Dust mites

CDC Split Type: USPFIZER INC2021005711

Write-up: Anaphylactic reaction 6 days post vaccine 24Dec2020; I had severe chest tightness; SOB; throat soreness; hoarse voice; mouth swelling; This is a spontaneous report from a contactable physician, the patient. A 34-year-old non-pregnant female patient received

the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EL0140), via an unspecified route of administration in the left arm on 18Dec2020 at 15:30 (at the age of 34-years-old) as a single dose for COVID-19 immunization. Medical history included severe dust mite allergy (based on skin test). Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medications included cetirizine hydrochloride (MANUFACTURER UNKNOWN), hydrocodone bitartrate/paracetamol (NORCO), ibuprofen (MANUFACTURER UNKNOWN), and ondansetron (ZOFTRAN); all for unspecified indications from unknown dates and unknown if ongoing. The patient did not receive any other vaccines within four weeks prior to the vaccination. On 24Dec2020 at 10:00, 6 days post vaccination, the patient experienced anaphylactic reaction, severe chest tightness, shortness of breath, throat soreness, hoarse voice, and mouth swelling; all reported as life threatening. The events led to an emergency room visit and she was given epinephrine (EPI-PEN), methylprednisolone (SOLUMEDROL), and diphenhydramine hydrochloride (BENADRYL) as treatment. The patient stated that she developed the reactions 45 minutes after she took premedications for a dilatation and curettage procedure. The premedications included ibuprofen, hydrocodone bitartrate/paracetamol, ondansetron. She stated she had taken these medications several times before and this was the first time she had this reaction. Since the vaccination, the patient had not been tested for COVID-19. The clinical outcomes of the anaphylactic reaction, severe chest tightness, shortness of breath, throat soreness, hoarse voice, and mouth swelling were recovered on unknown dates.; Sender's Comments: Anaphylactic reactions presented as chest tightness, shortness of breath, throat soreness, hoarse voice, and mouth swelling, developed 45 minutes after premedications including included ibuprofen, hydrocodone bitartrate/paracetamol, ondansetron for a dilatation and curettage procedure and 6 days post vaccination with BNT162B2, the event therefore is most likely attributed to these premedications unrelated to the vaccine use. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Diagnostic Lab Data: portable echo in ER: no effusion, inferior wall poorly visualized EKG: suggestive of Inferior Wall STEMI cardiac cath: RCA-Pd 100% at origin with TIMI 0 flow (infarct related artery) LV angio: inferior and inf-apical hypokinesia, EF approx 45% PCI (drug eluting stent placed to RCA-Pd) troponin T 4.250 NT Pro BNP 2231 SARS CoV-2 (agent for COVID -19) not detected by PCR glucose 106 Na 127 K 3.3 Cl 93 PTT 36.4 PT 13.7

CDC Split Type:

Write-up: Myocardial Infarction: patient began to complain of severe chest pain 3 hours after the vaccine was given .. Vaccine NDC # 59267-1000-1. 0.3 ml given by RN. Patient called his PCP: "... I had very bad chest and shoulder pains, neck pains and slight fever from 9 pm until early this morning (Jan 8). My blood pressure was 155/95 mmHg. Should I see you today? Still feel sore all upper body. Above message received at 0720 am (Jan 8) and the patient was called back at 0757 am (Jan 8): patient was told that many of the side effects above were

related to the vaccine but the chest pain was worrisome and the provider requested the patient go to the emergency room. Patient understood the importance to seek medical attention..... Emergency Room notes: seen by MD on Jan 9. Note at 0749: patient complained of chest pain on/off since received COVID vaccine on Jan 7. Pain was substernal and radiated to the left shoulder, assoc with some SOB. EKG obtained and revealed ST segment elevation and a "cardiac alert" was called.

Diagnostic Lab Data: EKG on 12/30/2020 with normal sinus rhythm

CDC Split Type:

Write-up: I am currently breastfeeding my 5-month-old son. I received my first vaccine on 12/28/2020 and directly breastfed within 4 hours of receiving the vaccine. Two days after my vaccine my son was at daycare and had two large diarrhea blowouts and two large emeses followed by a 1-minute episode where he was limp with entire body cyanosis and in-and-out of consciousness. He also had a maculopapular rash on his torso. EMS was called. He was observed in the emergency department for a few hours then recovered well without intervention and did not require hospitalization. EKG was normal. He has continued to be well and back to baseline since the event.

CDC Split Type:

Write-up: Dizziness, Headache, Myalgia, Tachypnea, CoughWheeze, NauseaVomiting, Palpitations & Tachycardia & Narrative: Patient stated that after receiving injection on 01/06/2021, tasted metal in her mouth. No reaction noted in clinic after vaccine administered. Patient states that after returning home, she began to have chills, headache, and muscle aches. Could not sleep. On 01/07/2021. Patient continued to experience above symptoms. Approx. 13:50 on 01/07/2021. Patient presented with respiratory difficult, tachypnea stridor, and stated she felt as if her airway was closing. Patient was vomiting and was tachycardic. Epi-pen administered via left lateral thigh. Patient administered 50mg of PO Benadryl, and 2 puffs of albuterol inhaler. Continuous V/S initiated. Patient began to experience relief of symptoms. HR and blood pressure remained elevated, but this was expected side effect of epi. SpO2 stabilized around 99% on room air. Patient was monitored for 60 minutes. Transportation home was arranged and family was present to observe overnight.

Current Illness: none.

Preexisting Conditions: Chronic migraines, usually without AURA, 2 times in life with aura, Transformed migraine into chronic daily headache after DEPO shot at 23 yo. Chronic neck pain, mild bulging disk, DDD. +ANA, non-specific. Pattern has been different 2 times (3 yrs ago, showed positive for lupus titers, but no lupus sx, so rheumatologist did not feel like I had lupus).

Allergies: PCN (rash), Septra (rash).

Diagnostic Lab Data: MRI/MRA Brain: 1/5/21: normal. MRA neck with and without contrast: 1/8/21: normal Holter monitor: pending (currently wearing) Echo: 1/9/21: normal Blood clotting workup: pending, but so far negative Neurologist Appointment: 1/7/21

CDC Split Type:

Write-up: I am not sure if related or not. This event was 13 days after my COVID-19 1/2 immunization. Otherwise, I am a very healthy physician, normal BMI, I have also been tested 5-6 times negative for COVID. I do get exposed in my job, but wear proper PPE. Viral infection in FEB that was like COVID-19 sx, I did AB test as soon as it was available, and negative. ---The Event: Monday morning (1/4/21), after getting out of shower, I was talking to my husband (who is MD) and started having BROCA's aphasia sx (could not get words out coherently), then fell into bed and started right wrist and right foot posturing. This lasted 10 min. I have non-memory of it, but my MD husband witnessed it. After 10 minutes, I was back to normal, except shaky and some word finding difficulties. After 30 min, totally back to normal.

Diagnostic Lab Data:

CDC Split Type:

Write-up: 38-year-old female who is healthcare worker and received first dose of COVID vaccine (Pfizer). Immediately after receiving the vaccine, patient developed lightheadedness, flushing, hives, wheezing and throat swelling. Patient was treated in an emergency department with epinephrine, gradually improved and was able to be sent home with an EpiPen, prednisone, hydroxyzine, and famotidine. The next day, patient again developed shortness of breath and her husband administered the EpiPen. EMS arrived and gave another

dose of IM epinephrine and IV diphenhydramine. On arrival to the emergency department, the patient was altered, diaphoretic, tachypneic, tachycardic, and stridulous. Patient was given multiple doses of IM epinephrine and started on epinephrine drip. Stridor continued and was unresponsive to nebulized albuterol. Patient was then intubated and placed on mechanical ventilation. Other treatments included solumedrol, pepcid, magnesium sulfate, nebulized epinephrine, and IV fluids. admitted to the intensive care unit, weaned off epinephrine drip, and extubated the next day. Patient was monitored on hospital floor for one additional day and was then discharged with no residual symptoms.

Previous Vaccinations:

Other Medications: ; ; LEVOTHROID; WELLBUTRIN

Current Illness:

Preexisting Conditions: Medical History/Concurrent Conditions: ADHD; Adrenal insufficiency; Congenital hip dislocation; Hypermobility syndrome; Hypothyroidism; Paroxysmal supraventricular tachycardia

Allergies:

Diagnostic Lab Data: Test Date: 20210106; Test Name: Nasal Swab; Test Result: Negative

CDC Split Type: USPFIZER INC2021011058

Write-up: anaphylaxis; throat tightening; throat tightening/tingling; throat tightening/tingling/soreness; dry wheezy cough a little dizziness; dizziness; tachycardia; Itching; chills; numb R foot; Low grade temp; h/a today; This is a spontaneous report from a contactable Nurse (patient). A 51-years-old female patient (no pregnant) started to receive bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number el3248), via an unspecified route of administration on 06Jan2021 11:00 at the first single dose at left arm for covid-19 immunisation. Medical history included supraventricular tachycardia, adrenal insufficiency, hypothyroidism, attention deficit hyperactivity disorder, hypermobility syndrome, developmental hip. Concomitant medication included hydrocortisone, trazodone, levothyroxine sodium (LEVOTHROID), bupropion hydrochloride (WELLBUTRIN). The patient previously took erythromycin, morphine and experienced drug hypersensitivity. The patient experienced anaphylaxis, throat tightening/tingling/soreness, dry wheezy cough a little dizziness and tachycardia. Itching, numb R foot, Low grade temp and chills and headache on 06Jan2021 11:15. Seriousness criteria reported as life threatening. Taken to ER had IV benadryl, solumedrol, pepcid for anaphylaxis. Placed on O2 and given albuterol nebulizer.

Had IV fluid bolus. Now on benadryl and 5 days of prednisone. The patient felt completely fine prior to vaccine. The patient underwent lab tests and procedures which included sars-cov-2 test: negative on 06Jan2021. The outcome of events was recovering. No other vaccine in four weeks; No covid prior vaccination.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of anaphylaxis presented as throat tightening/tingling/soreness, dry wheezy cough a little dizziness and tachycardia. Itching, numb R foot, Low grade temp and chills and headache cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The underlying predisposing condition of drug allergies may put the patient at high risk of anaphylactic reactions. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Diagnostic Lab Data:

CDC Split Type: USPFIZER INC2021015751

Write-up: Anaphylactic reaction; Flushed; Diaphoretic; redness and rash; hives on chest; Tachycardia; shortness of breath; Chest tightness; Dizziness; Headache; This is a spontaneous report from a contactable nurse, the patient. A 47-year-old female patient

received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EL1283), via an unspecified route of administration on 08Jan2021 at 08:49 (at the age of 47-years-old) as a single dose for COVID-19 immunization. There were no known medical history or concomitant medications. The patient previously received the first dose of BNT162B2 on 18Dec2020 (Lot Number: EK5730) for COVID-19 immunization and experienced nausea, headache, and fatigue. On 08Jan2021, about 5-10 minutes after the second dose, the patient experienced anaphylactic reaction, flushed, diaphoretic, redness and rash, hives on chest, tachycardia, shortness of breath, and chest tightness, reported as life-threatening. She reported that these events occurred within less than 10 minutes of receiving the vaccine. She went to the emergency room and was treated with methylprednisolone (SOLUMEDROL), diphenhydramine hydrochloride (BENADRYL), famotidine (PEPCID), and epinephrine (MANUFACTURER UNKNOWN). She was sent home and prescribed methylprednisolone and epinephrine (EPI-PEN). Later on 08Jan2021, she experienced dizziness and headache, which were consistent. She stated she would most likely take ibuprofen (MOTRIN) as treatment (not specified if taken). The clinical outcomes of the flushed, diaphoretic, redness and rash, hives on chest, tachycardia, shortness of breath, and chest tightness were recovered on 08Jan2021; while the outcomes of the dizziness and headache were not recovered and that of the anaphylaxis was reported as recovering.; Sender's Comments: The reported information is limited. Based on the close temporal relationship and the description of the events, there is a reasonable possibility that the events are related to BNT162 vaccine. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Previous Vaccinations: Allergic reaction with swelling, flushing, rash, migraine. And another was neurological changes. Third one was fainting, chills,

Other Medications: Lexapro, Synthroid, One-A-Day Prenatal Vitamins, Culturelle Women's Health probiotic, Flonase, Tylenol.

Current Illness: Seasonal allergies

Preexisting Conditions: Anorexia nervosa, eczema, GERD, chronic low back pain, seasonal allergies. H/o anaphylaxis x2 in 2019 unknown etiology.

Allergies: Latex sensitivity, sulfa antibiotics, Gardasil, Voltaren. Flu vaccine 2014. Soy intolerance, seasonal allergies. Pertussis vaccine in 1986. Had TDaP 12/2019 no r?action. Influenza vaccine 2014, had flu vaccine 2019 and 2020 no issues.

Diagnostic Lab Data: Continuous telemonitoring (Ekg, heart rate, respirations, O2 saturation) while in ER Physical assessment of body and lungs/throat

CDC Split Type: vsafe

Write-up: -0715 vaccine administered. -0735 started to feel dizzy/off and right side of tongue felt like it was mildly swelling and itchy. -0735 asked to have blood pressure taken as know when I am having anaphylaxis my blood pressure escalates. -0740 took blood pressure and it was 141/86 in right arm. Normal is 110s/60s-70s. No anxiety feelings. -0740 throat started to have increased mucous production. Had the tickle and tightness in throat. Asked and received

25mg Benadryl with cup of water. -0742 started clearing throat frequently and slight cough. Knew it was anaphylaxis and told the team I need to go to the ER. Asked for additional 25mg Benadryl. Also took 20mg Famotidine and 2 puffs Albuterol inhaler--this is my prescribed anaphylaxis routine. Had Epipens on standby. -0743 put on O2 saturation monitor and watched O2 drop into 90-92 range. Asked for epipen on standby as I know when I need to start it. Didn't want to take that when I knew I was about to get it in the ER and knowing self hadn't progressed that far. Felt chest tightness and shortness of breath. Voice started becoming hoarse. -0800 EMS arrived (delay as team didn't know if they were supposed to call 911 or a Code--they chose EMS even though in hospital). Then staff at COVID vaccine clinic kept emphasizing need to go in ambulance while EMS and self fought to go through hospital (much quicker route). Finally cleared to go through hospital to ER. To get some air via breathing in had to sit up leaning forward. Voice completely hoarse by this time. -About 0817 arrived to ER bay. At this time, frequently coughing and cough started to sound stridorous. Difficulty getting breaths in. Had chest pain near heart. Greeted by MD, 2 RNS, and technician. -0819 received IM epinephrine. Attached to 5 lead EKG monitoring and O2 monitoring. Blood pressure done again. Higher than previous. -About 0821 had working IV (previous two attempts failed as veins were constricting). Given IV Solumderol. Started bolus of 1L Normal Saline. -Not sure how long after by cough subsided, increased mucous production subsided, as well as hoarseness decreased. -Held for observation for 2hours (would be longer if not resolved). - Discharged around 1015. At this time, hoarseness almost all gone. Minimal throat clearing. Cough resolved. -Prescribed epipen inhalers (mine expired) and Prednisone. Prednisone is PRN for mild breathing difficulties if it starts again tomorrow 1/13/21. -At 1400 took 50mg Benadryl and 20mg Famotidine as previously prescribed for anaphylaxis maintenance. Will continue this as previously prescribed every 6hours until symptoms stay resolved. -Made follow up appointment with Primary Care Physician per protocol

Current Illness: none

Preexisting Conditions: PCOS

Allergies: shellfish- anaphylaxis

Diagnostic Lab Data:

CDC Split Type:

Write-up: within 1 hr post-vaccine on 1/7 I had a mild headache that resolved with Tylenol. At about 12 hours post-vaccine I developed nausea, fever (100.4) and chills and secondary to this had poor sleep. The next day I took scheduled alternating Tylenol & ibuprofen during the day and then overnight 1 episode of chills that woke me up. no events Saturday or Sunday. Then Monday 1/11 in the early morning I started to develop a rash on my b/l elbow and right foot 3rd toe. I applied mometasone topical cream to these locations. while at work the rash extended down both forearms then by 5pm it was on both hips and extending along both legs. I applied Benadryl cream to the most irritated sites and took PO Benadryl 50mg at bedtime and again at 1am when the itching woke me up. I repeated Benadryl 25mg at 8am. The rash seems to be getting better on the arms but then by noon I had a new breakout on my neck and face. I took Benadryl 50mg at 1pm. The rash continued to have a rapid progression over the next hour and resulted in angioedema with my throat swelling, lips puffed and numb and eye swelling. I was injected with an epi pen and sent to the ED where I received PO prednisone, famotidine, and Benadryl. The face/neck rash then greatly improved and I was sent home on prednisone 40mg daily for 3 days.

CDC Split Type:

Write-up: 2230 feeling of unease, body aches, site arm tingling, general mild aches 0220 awoke from sleep choking, having difficulty breathing, felt very SOB, worse with exertion or trying to speak, great difficulty swallowing and speaking even in brief words. Took 50mg of Benadryl PO and went to the ED, about a 15 minute car ride. Had tingling and numbness of the tongue and back of throat by arrival but still able to breath with focus. Exertion of just walking into the ED greatly increased the SOB. Was triaged, Benadryl starting to help, was able to speak a little better, 3-4 words without too much SOB caused. Was walked to a room, SOB milder with that exertion. Seen by Dr. Given IV Sol-u-Medrol and 50mg Benadryl. Was observed on cardiac monitor/Q15VS for a few hours and discharged home around 5:30. Given Rx of Prednisone 20mg -3tabs x2 days, 2tabs x5 days all once a days and told to take 50mg of Benadryl Q4H for the next 24 hours at least and to return prn. I did need to stay on Benadryl, as the Sol-u-Medrol wore off some of the swelling in thr throat did return but not severe, Benadryl did help, along with taking my Asthmnex I already had. I also continued my normal HS antihistamines. I had SOB on exertion, progressively better from the 6th-10th with it mostly resolved to yesterday. Body aches have continued but also progressively better. Yeasterday1/12/21 the Rx of prednisone was completed and I did have some mild swelling /tingling in the throat/face/mouth return in the evening, took Benadryl 50mg again and inhaler used. I have an appointment today to seek further care at my primary doctor"s office. Asthmmax used again this morning as well, only mild tightness in the throat currently with mild body aches this whole time.

Allergies:

Diagnostic Lab Data: Test Date: 20210102; Test Name: blood pressure; Result Unstructured Data: Test Result:dropped to 70/40; Test Name: oxygen levels; Result Unstructured Data: Test Result:normal; Test Date: 202012; Test Name: COVID; Result Unstructured Data: Test Result:positive; Comments: testing positive in mid December to COVID and being declare Covid free on 30Dec.; Test Name: vitals; Result Unstructured Data: Test Result:normal; Test Name: vitals; Result Unstructured Data: Test Result:improved significantly

CDC Split Type: USPFIZER INC2021013942

Write-up: she was dying as her blood pressure dropped to 70/40 and to come for a last visit; This is a spontaneous report from a contactable consumer. A 100-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 02Jan2021 at single dose for COVID-19 immunization. Medical history included COVID in Dec2020, urinary tract infection (UTI), dehydration and Covid sickness (vomiting) (was treated earlier in month for UTI and dehydration from the Covid sickness (vomiting)). Known allergies: no. The patient's concomitant medications were not reported. After testing positive in mid December to COVID and being declared Covid free on 30Dec by the nursing staff and in good health, with normal vitals and oxygen levels, the patient was

given a vaccination on 02Jan2021. In the early evening the patient's blood pressure dropped to 70/40 and the reporter was told to come for a last visit. The patient was sleeping comfortably. She did not wake up when spoke with her. No one expected her to make it through the night. The next morning she work up, ate breakfast, watched TV, got IVs and oxygen and her vitals improved significantly. Lab tests and procedures included blood pressure: 70/40 on 02Jan2021, oxygen levels: normal, COVID test: positive in Dec2020 (testing positive in mid December to COVID and being declare Covid free on 30Dec), vitals: normal; improved significantly. Facility where the most recent COVID-19 vaccine was administered: Nursing Home/Senior Living Facility. If the patient received any other vaccines within 4 weeks prior to the COVID vaccine: No. Prior to vaccination, was the patient diagnosed with COVID-19: Yes. Since the vaccination, has the patient been tested for COVID-19: No. AE resulted in: Life threatening illness (immediate risk of death from the event). Serious: Yes. Seriousness criteria-Results in death: No. Seriousness criteria-Life threatening: Yes. Seriousness criteria-Caused/prolonged hospitalization: No. Seriousness criteria-Disabling/Incapacitating: No. Seriousness criteria-Congenital anomaly/birth defect: No. Information about lot/batch number has been requested.

Other Medications: Labetalol, Buspirone, Rosuvastatin, Levothyroxine, Lisinopril, Bupropion, Gabapentin, Rabeprazole, Probiotic, Vitamin D, Cevimeline, Scopolamine

Current Illness:

Preexisting Conditions:

Allergies:

Diagnostic Lab Data: 12/21/2020 CBC, metabolic panel, CT scan

CDC Split Type:

Write-up: Went to bed not feeling well. My husband came to check on me approx. 12:30 am. He was unable to arouse me. When he tried to get me up out of bed I collapsed and then had syncopal episode. He call 911. Paramedics could not get blood pressure and I was diaphoretic and body temp was cold. They rushed me to the hospital. My blood pressure was dangerously low along with my body temperature. I was given epinephrine and LEVOPHED to get a blood pressure. I was warmed up. Then I had GI issues of vomiting, diarrhea, nausea. I spend 4 days in hospital.

Previous Vaccinations:

Other Medications: Employee is currently taking anti seizure medications

Current Illness: None

Preexisting Conditions: non-epileptic seizure disorder

Allergies: None known

Diagnostic Lab Data:

CDC Split Type:

Write-up: Employee was awoken at 5:30 am on 1/13/2021 by chills and a feverish feeling. She then became nauseous and faint. She passed out and was noted by her mother who is a RN to have a seizure. She remained out for several minutes and then aroused. She has remained groggy the rest of today but has improved. She has a history of non-epileptic seizures since she was 14 and has been on medications for this. Employee stated she has not has any seizure activity in over a year. She did not see medical attention due to recovering quickly from this.

Previous Vaccinations:

Other Medications: Vitamin D, C, Zinc, Selenium, Tamsolusin, Rosuvastatin, Aspirin

Current Illness: no

Preexisting Conditions: no
Allergies: NKA
Diagnostic Lab Data: none
CDC Split Type:

Write-up: about 14 hours after vaccination I experienced what appeared to be a severe case of Cytokine storm. I had a moderate case of COVID in May 2020 and had positive IgG AB in August. The symptoms started with heavy shaking chills, lasting 1 1/2 hours , fever and most concerning sustained tachycardia with heart rate of 180" to 200" over hours, which then destabilized into runs of Vtach and complex ventricular dysrhythmia, low BP, profound weakness, head aches and joint and muscle pains (similar to the experienced COVID symptoms)

Previous Vaccinations:

Other Medications: Aspirin, atorvastatin, citalopram, metoprolol, vitamin D.

Current Illness:

Preexisting Conditions: CAD, hyperlipidemia, HTN, smoker

Allergies: sulfa, nicotine patch adhesive

Diagnostic Lab Data: CTA showed 80% stenosis of R MCA. MRI head showed small, acute lacunar infarct in the R MCA distribution.

CDC Split Type:

Write-up: She got the vaccine on Dec 23, and then on Jan 4 she had a mild stroke with left sided arm and face weakness. She did recover fully. She already has known CAD and risk factors for CVD. It is possible, but by no means certain, that the vaccine was an indirect cause of the event. Since the vaccine provoked an immune response, as it was supposed to, it is possible that this inflammation may have set up a metabolic predisposition that may have contributed to the event, which was 12 days later.

Previous Vaccinations:

Other Medications: Multivitamin

Current Illness: No

Preexisting Conditions: None

Allergies: No

Diagnostic Lab Data: N/a

CDC Split Type:

Write-up: Began with tingling/itching to tongue and roof of mouth approx 15 minutes after administration, progressed to tingling of lips, was sent to the ED for observation. Within 20-30 minutes developed cough, throat tightness, difficulty swallowing, breathing, vomiting, shortness of breath. Noted to have uvular swelling and wheezing on examination. Given Benadryl, Pepcid, Solumedrol, Zofran, Albuterol MDI, Epi IM. within a few minutes symptoms returned and were worse where I felt like I could not breathe, throat was closing, could not talk. Noted to be pale, HR in 140's. Given second dose of epi IM and symptoms improved. Was transferred to Obs Unit., within 2 hours (approx 6 hours after administration), developed SOB, throat tightness, cough, vomiting, difficulty breathing. Again noted to have swelling of uvula, wheezing on exam. Given Solumedrol, Benadryl, SQ epi, Albuterol, Racemic Epi nebulizer. Was transferred to ICU, all meds held except Pepcid. Day #2 ~10 am (25 hours from administration) developed throat tightness, diffuse red rash to arms, difficulty breathing, vomiting. Again noted to have uvular swelling and wheezing. Given Solumedrol, Benadryl, Pepcid, Albuterol MDI, Racemic Epi neb. Solumedrol started q12hour dosing. Strange

feeling/fullness in throat continued all day, got additional racemic Epi neb that night with improvement of symptoms. Following morning (day#2 after vaccine) noted to have diffuse red rash to chest and face, spread to arms, then began coughing. Given Solumedrol, Pepcid, Benadryl, Advair, Racemic Epi nebulizer. Solumedrol changed to q8 dosing. Approx 4 hrs later nurse noted rash worse on face, associated with itching, throat tightness. Given additional Benadryl, Racemic Epi neb with improvement. Rash continued that night with throat tightness, got additional Benadryl and Racemic Neb that night (total of 3 Racemic nebulizer on Day#2 post vaccine). Transferred to telemetry floor. Day#3 post vaccine rash improved, but still present to chest and face. Throat fullness present, especially after drinking. Am still hospitalized while writing this report

Other Medications: Systane drops, Lipitor, Mirtazapine, Digoxin, Lasix, Aspirin, Cymbalta, Trazodone, Levothyroxine, Depakote, Biofreeze, Senna, Neurontin, Risperidone, Flovent HFA,

Current Illness: Resident has slowly been declining over the past several months. Physically he went from being able to walk, to needing the E-Z stand to transfer and most recently has become total assist with all ADL cares.

Preexisting Conditions: Cerebral Infarction, Occlusion and stenosis of left carotid artery, COPD, Hyperlipidemia, Hallucinations, Hypertension, Dizziness, Anxiety, Dementia

Allergies: No known allergies

Diagnostic Lab Data: Resident has a history of strokes with his most recent stroke being on 2/15/20 (Acute Ischemic Stroke).

CDC Split Type:

Write-up: On 1/12/20 resident woke up and was not able to stand in the E-Z stand. E-Z lift was needed. In addition he needed assistance with eating. At that time VS were stable, equal hand grasp noted, and no further concerns. Around 3pm resident became flaccid on the left side of his face and speech became mumbled. Hand grasp was equal at that time and VS were stable, but B/P was elevated compared to previous recordings earlier in the day. Family did not want him sent to the hospital and asked for comfort cares. Hospice referral obtained and he will be admitted to hospice in the near future. Resident's left side of face has improved within the last 48 hours. He remains total assist with all cares.

CDC Split Type: USPFIZER INC2021014540

Write-up: He collapsed with left sided hemiparesis; Stroke; Rt basal ganglia hemorrhage w/ edema and mass effect.; Rt basal ganglia hemorrhage w/ edema and mass effect.; Low platelets, 114; His bp as high as 200s/100; Hand weakness; Myalgia; Fever; Severe fatigue; This is a spontaneous report from a contactable physician. A 58-year-old male patient received first dose of bnt162b2 (Pfizer BioNTech COVID vaccine), intramuscularly on 16Dec2020 at a single dose for COVID-19 immunization. Medical history included hypertension with reported med noncompliance in the last few months due to stress. Concomitant medication included hypertension medications in two weeks. The patient was presumed neg covid status prior to vaccine. He worked as a Pulm/critical care physician. He reported fever, myalgia, fatigue on 16Dec2020. Next day (17Dec2020), he took off from work due to his symptoms. The following day (18Dec2020), he came to work. He c/o ongoing severe fatigue & hand weakness in am. Staff noted him to be evaluating his hands during clinic. At 12:15, he collapsed with left sided hemiparesis. The reporter had suspicion for stroke. He was transported to the Emergency Room (ER), head CT showed Rt basal ganglia hemorrhage w/ edema and mass effect. Labs notable for Low platelets, 114 (unknown baseline) on 18Dec2020, normal coags on an unspecified date. BP recorded as 179/101, but it was noted in trauma room his bp as high as 200s/100. He had a history of hypertension with reported med noncompliance in the last few months due to stress. Patient was transferred for further care. Full course was unknown but had rebleed there with low plts. Adverse event (he collapsed with left sided hemiparesis) resulted in hospitalization (22 days), life threatening illness (immediate risk of death from the event), disability/incapacitating or permanent damage. Treatment was received for adverse events. Results of tests and procedures for investigation of the patient: on 18Dec2020, Nasal Swab test: negative. The outcome of events was not recovered. Unknown if any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient was not tested for COVID-19. Information on the lot/batch number has been requested.; Sender's Comments: Collapsed with left sided hemiparesis/suspicion for stroke are as consequences of basal ganglia hemorrhage with edema, which is caused by worsening of hypertension. Low platelet also contributes to brain hemorrhage. All these serious events are unrelated to the vaccine use. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Ek5730) on left leg on 18Dec2020 at 11:00 AM at single dose for covid-19 immunisation. The patient previously took Codeine, fish oil and experienced allergies. Friday at 3pm, the patient had numbness and tingling to left hand, lips and throat. On Saturday the patient had sweating, chills, headache, nausea. On Sunday had emergency appendectomy for acute appendicitis. Post surgery had allergic reaction unknown reason with head to toe rash. It was also reported that the adverse event started on 08Jan2021 at 03: 15 PM (as reported). The patient had 1-day hospitalization. The patient received treatment for the events. The adverse events resulted in Emergency room/department or urgent care. The events were reported as serious due to life threatening and hospitalization. The most recent COVID-19 vaccine was administered at hospital. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The outcome of the events was recovering.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. Medications administered during appendectomy may confound reactions experienced post-surgery. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

CDC Split Type: USPFIZER INC2021023309

Write-up: she was diagnosed with bilateral deep vein thrombosis (DVT) and pulmonary embolism (PE); she was diagnosed with bilateral deep vein thrombosis (DVT) and pulmonary embolism (PE); This is a spontaneous report from a contactable nurse (patient). A 22-year-old female patient received 2nd dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# EK9231), via an unspecified route of administration in left arm on 06Jan2021 13:45 at single dose for COVID-19 immunisation. Medical history included allergy to all fish, and clots. The patient was not pregnant. There were no concomitant medications. The patient previously received 1st dose of BNT162B2 (lot number: EH9899) in left arm on 16Dec2020 13:45 for COVID-19 immunisation and experienced left sided lower back pain on 20Dec2020. No other vaccine received in four weeks. It was reported that the patient had the first covid vaccine on 16Dec2020 and on 20Dec2020 started with left sided lower back pain and then received the second on 06Jan2021 and then on 09Jan2021 11:00 her legs became blue and swollen and she was diagnosed with bilateral deep vein thrombosis (DVT) and pulmonary embolism (PE). The patient otherwise healthy and had never had covid. Other than the clots, she had no other health issues. The patient underwent lab tests and procedures which included nasal swab: negative on 09Jan2021. Events resulted in doctor or other healthcare professional office/clinic visit, emergency room/department or urgent care, hospitalization, and life threatening illness (immediate risk of death from the event), hospitalized for 2 days (in Jan2021). Adverse event treatment: heparin drip and xarelto at home. Recovered with lasting effects on an unspecified date of Jan2020. This case was reported as serious, serious criteria was life threatening, caused/prolonged hospitalization.; Sender's Comments: The underlying risk factors/predisposing condition of thrombotic diathesis have been assessed to have played a contributory role toward the events.

Allergies:

Diagnostic Lab Data: Test Date: 20210109; Test Name: covid test; Test Result: Negative

CDC Split Type: USPFIZER INC2021021415

Write-up: started with left sided lower back pain; This is a spontaneous report from a contactable Nurse (patient). A 22-year-old female patient received the first dose of BNT162B2 (lot number: EH9899), via an unspecified route of administration at left arm on 16Dec2020 13:45 at single dose for covid-19 immunization. Medical history included allergies for All fish. The patient's concomitant medications were not reported. The patient had the first covid vaccine on 16Dec2020 and on 20Dec2020 started with left sided lower back pain. The event resulted in Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care, Hospitalization (2 days), Life threatening illness (immediate risk of death from the event). The patient received the Heparin drip and xarelto at home for the event. The patient was not pregnant. The patient received the covid test post vaccination on 09Jan2021. Test type was Nasal Swab. The result was negative. The outcome of the event was recovered with sequel on unspecified date.; Sender's Comments: From the information provided it is unclear what is the nature of the reported event and what are the reasons that have put the subject at immediate risk of death. The event is considered possibly related to the suspect product based on the positive temporal association.

Diagnostic Lab Data:

CDC Split Type: USPFIZER INC2021021602

Write-up: throat closing up; struggled the breath; This is a spontaneous report from a contactable consumer (patient). A 44-year-old female patient (non-pregnant) received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: Pfizer EL 3302), via an unspecified route of administration on 09Jan2021 07:30 am at single dose at left arm for covid-19 immunization. Medical history included diabetes, high blood pressure, allergies. The patient's concomitant medications were not reported. Patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination. Since the vaccination, patient has not been tested for COVID-19. On 10Jan2021 14:30, patient woke up with throat closing up and struggled the breath. Patient immediately drank a dose of diphenhydramine hydrochloride (BENADRYL). Patient did that two more time in the evening of 10Jan2021. Patient called the doctor in the morning. Events were considered serious per life-threatening. The adverse events resulted in doctor or other healthcare professional office/clinic visit, life threatening illness (immediate risk of death from the event). Patient received treatment liquid diphenhydramine hydrochloride, epinephrine (EPI-PEN) for events. Outcome of events was recovered in Jan2021.

Previous Vaccinations:

Other Medications: lexothyroxine, vitamin D, montelukast, manesium citrate

Current Illness: Sinus infection at the beginning of December treated with augmentin

Preexisting Conditions: hypothyroidism, allergic rhinitis

Allergies: NKDA

Diagnostic Lab Data: PCR covid test 1/4/21 negative Chest Xray 1/6/21 negative at the ER at the Medical Center on 1/10/21 d-dimer levels were very high, chest CT showed multiple bilateral pulmonary emboli, leg US revealed bilateral emboli

CDC Split Type:

Write-up: Onset of shortness of breath and cough on 1/3 that progressively got worse. Clinical diagnosis of pneumonia without fever was made, patient started azithromycin on 1/5 and albuterol treatments every 4-6 hrs. Initially he improved, but then worsened. chest xray on 1/6 was negative for pneumonia, PCR covid test was negative, albuterol treatment did not bring much relief. He started respiratory distress on 1/10 and was taken by car to the local ER where another covid test was negative and chest CT revealed multiple bilateral pulmonary emboli. The leg US revealed blood clots in both of his legs. He had an emergency catheter-delivered thrombolysis and was discharged home from the ICU on 1/12 on oral anticoagulants. He is gradually improving, but very weak. He tires easily and gets a drop in oxygen to 90- 93%, as well as an increase in the heart rate to 120 when walking less than half a mile. He runs out of breath with exertion.

Previous Vaccinations:

Other Medications: Synthroid 112mcg once per day

Current Illness: Recent doagnosis of SVT (12/20)

Preexisting Conditions: Thyroidectomy 2/14, now on replacement therapy Overweight

Allergies: None

Diagnostic Lab Data: All of my medical workup was done at Hospital. On admission I had a CBC, CMP, Troponin, CT of the abdomen and pelvis, CXR, Type and Cross, PT/PTT done. Of note my WBC was elevated to 13 and my CT was abnormal revealing appendicitis. My cultures and pathology intraoperatively have been negative.

CDC Split Type:

Write-up: I had no side effects after my vaccine on 12/24/20 until 1/8/21. On Friday, 1/8/21 at 830pm I began with severe abdominal pain, low grade fever, nausea and loss of appetite. My abdominal pain persisted and worsened over the next 24-36hours. I presented to the ER on Sunday, January 10, 2021 at 8am with severe right lower quadrant pain, pelvic pain, nausea and low grade fever. I was promptly diagnosed with appendicitis and taken to the OR at approximately 2pm on the same day. In the OR my appendix was gangrenous, there was pus in the pelvic area and fluid in my peritoneum. My appendix was not ruptured. My appendix was removed as well as part of the omentum. I remained in the hospital on IV Metronidazole and Ciprofloxacin for 2 days and was discharged on 1/13/21 at 9pm. I am continuing to recvoer at home on the same 2 antibiotics in oral form. I have a JP drain that is still in place. Of note I had two negative COVID 19 tests on 1/9/21 and 1/10/21. Both were PCR tests.

Diagnostic Lab Data:
CDC Split Type:

Write-up: We (myself and 2 other pharmacists) were conducting a COVID-19 vaccine clinic. The patient is on staff at the clinic and came in for her 1st dose of the Pfizer/BioNTech COVID vaccine. 10 minutes post-vaccination, patient started experiencing SOB, tingling fingers and face, and swelling of her lips and tongue. She moved herself outside to cooler air and then sent someone back inside to ask us for help. I ran outside with an EpiPen and immediately noted her pulse of 158 on her watch and she appeared to be experiencing an anaphylactic reaction. Patient stated she did not want to use the EpiPen but wanted to try chewing Benadryl instead first. I asked the staff for a blood pressure monitor and pulse oximeter. The 1st readings, approximately 12 minutes after vaccination, were HR 158, BP 155/105, and pulse ox 97%. Patient stated the Benadryl was working and her swelling was decreasing. The patient was not having trouble breathing at the time. I continued monitoring vitals and talking with the patient and approximately 20 minutes post-vaccination, she was improving (BP down to 134/80 and HR 120) but agreed we should call 911. She decided she wanted to move inside and lie down. I escorted her with support to a bed. Her vitals then increased again to BP 152/95 and HR 133 and her lips and tongue started swelling again. The patient appeared to be more labored in breathing then but still refused the EpiPen. Roughly 5 minutes after lying down, the medics showed up and took over and I went back to the vaccination area. I learned later that the patient refused to go to the hospital and after more observation was eventually allowed to leave with a friend/coworker driving her home.

Previous Vaccinations:

Other Medications: Ethinol Estradiol Levothyroxine

Current Illness: none

Preexisting Conditions: none

Allergies: Percocet allergy: hives

Diagnostic Lab Data: See above Troponin elevated 1/14/21 Abnormal EKG 1/14/21 Abnormal ECHOCardiogram 1/14/21 Takotsubo Cardiomyopathy (also known as stress induced cardiomyopathy) Normal coronary angiogram 1/14/21

CDC Split Type:

Write-up: At 6 days after my second COVID-19 Pfizer vaccine (first dose given 12/17/20), I had acute onset of chest pain and shortness of breath prompting a trip to the Emergency Department. A chest CT Angio to rule out pulmonary embolus was done and negative for pulmonary embolus. My EKG showed some mild ST changes and a troponin I level was elevated at 0.08 (normal 0.04). Subsequent troponin levels 90 minutes apart showed a rising troponin at 0.18 and 0.38. An echocardiogram was performed which showed regional wall motion abnormalities consistent with Takotsubo cardiomyopathy and an ejection fraction of 45%. I was then taken to cardiac catheterization lab for coronary angiograms which were normal. My LV angiogram was consistent with Takotsubo cardiomyopathy and my LVEDP was elevated. I was started on a beta blocker and sent home the following day.

CDC Split Type:

Write-up: Per husband, was in usual state of health on the AM of 1/10/20, AOx3 able to perform all I/ADLs. At around 2:30pm that day was complaining of chills and generalized malaise. Then at ~9:30pm when husband returned home from work found patient diaphoretic, confused (stating things like "not now, I want to go to lake"), and complaining of chills and weakness. Unable to provide any additional hx regarding other sx. Initially presented to ED, where mental status had deteriorated to AOx0, unable to respond to verbal commands. Initial vitals notable for T102.6F (unclear other vitals). Patient is now AOx0 most concerning for encephalopathy.

CDC Split Type:

Write-up: The patient received her first Moderna COVID-19 vaccination on 12/29/2020. However the patient was diagnosed with a positive COVID-19 test on January 4, 2021. Patient complained of nausea, vomiting, back pain, and sharp chest pain. On January 13, the patient presented to the emergency department again with shortness of breath and sharp, stabbing left-sided chest pain radiating to her back and right side. Initial work up ruled out cardiac etiologies. CTA chest demonstrated COVID-19 pneumonia. The patient complained of bilateral lower extremity weakness which had been progressing since her COVID-19 vaccination, per patient report. However, during her hospitalization the patient's bilateral lower extremity weakness began to accelerate. On the 13th, the patient was able to ambulate to and from the bathroom herself. Then on January 14 the patient required maximum assistance. Neurology was consulted and work up initiated for suspected possible Guillain-Barré syndrome (GBS) secondary to recent COVID-19 infection. On January 15, 2021, the patient became obtunded and unable to protect airway. She was emergently intubated for acute hypercapnic respiratory failure secondary to GBS. Neurology started GBS treatment with IVIG. Patient also developed NSTEMI and Takotsubo cardiomyopathy. Patient remains critically ill requiring mechanical ventilation.

CDC Split Type:

Write-up: The day after receiving the second vaccination, I began to have mild intermittent abdominal pain 2-3/10. The pain gradually increased, became more intense, and more constant. Mild fever and chills started happening, and I took Ibuprofen. By about 4 days after the vaccine, the abdominal pain was severe enough that I had some difficulty walking and I couldn't sleep at night. Pain was 6-8/10. I went to the ER, and CT scan with IV contrast showed 18 mm appendicitis. I underwent laparoscopic surgery and it was found to be perforated. It was removed. I am currently recovering in the hospital. I received the vaccine as a health care provider at my hospital, specifically I am a practicing pediatrician physician for over 10 years.

Diagnostic Lab Data:

CDC Split Type: USPFIZER INC2021019099

Write-up: anaphylactic reaction/anaphylaxis; This is a spontaneous report from a Pfizer Sponsored Program from a contactable pharmacist. A female patient of an unspecified age received first dose of bnt162b2 (Pfizer BioNTech COVID vaccine, lot number: EK4176), via an unspecified route of administration on 09Jan2021 at 0.3 mL, single (standard like 0.3ml by injection once to deltoid, side unknown) to prevent from getting COVID. The patient's medical history and concomitant medications were not reported. The patient experienced anaphylactic reaction/anaphylaxis on 09Jan2021. Clinical course: The patient got the vaccine while waiting to go into the watch room, to be watched for a few minutes, and she experienced anaphylactic reaction/anaphylaxis, she went down, they gave her an Epinephrine, she didn't respond to the first dose, a second dose was given in the arm where the vaccine was given, then she was picked up by an ambulance. Agent stated the caller has been on hold for almost an hour. Caller clarifies dose was given in the arm, it occurred on Saturday with the same lot. Saturday and it went away on Saturday, the patient was worried about it coming back, thus why she asked about Epinephrine pen, the patient was taken to the hospital, and given Epinephrine a couple more times, and it resolved eventually, the patient was not admitted, she went to the Emergency Department. It could have required hospitalization but would most likely say life threatening had she not been treated. Reporter seriousness for anaphylaxis is life threatening. The outcome of event was recovered on 09Jan2021. Relatedness of bnt162b2 to reaction anaphylaxis is related for primary source.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset anaphylactic reaction/anaphylaxis cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review

and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Diagnostic Lab Data:

CDC Split Type:

Write-up: Pt is 33 yo female with h/o multiple drug allergies , including allergy to benadryl. She has received first dose of COVID vaccine made by Phfizer at 3:45. She reports about 10 minutes after the vaccination she started feeling tingling in her lips, throat and prickly sensation on her chest and feeling "off". Felt dizzy, developed small hives on her chest. She was attended to immediately at the vaccine site and our team was called to white code. Pt was sitting on the floor, alert , breathing comfortably. Her BP was 151/84, HR 90, O2 Sats 100%. Her lungs were clear the whole time, no wheezing, no difficulty swallowing or talking. Patient received 125 mg of IV solumedrol and 20 mg of pepcid in vaccination room, she felt

the same, still breathing comfortably, speaking full sentences, hives fading away. She was transported to Urgent Care clinic on wheelchair. Pt kept her EpiPen by her side the whole time but refused to use it, states she is afraid to use it and wants to hold off or get it in ER if necessary. About 16:30 patient reported her tingling, prickly sensation In her chest is getting worse, developed sensation of lump in her throat, able to swallow and breath without problems, lungs exam clear. Again recommended to give EpiPen but patient again refused as she feels very anxious about getting new medicine. She was able to speak full sentences and breathing well, O2 Sats 100% the whole time, she repetitively refused EpiPen. EMS called and patient transported to ER, ER notified. Pt left in stable condition.

Diagnostic Lab Data: EKG , blood pressure , pulse , pulse ox all performed by firemen rescue staff at around 630pm on the evening of the day I received the vaccine

CDC Split Type:

Write-up: I was vaccinated at 3:30pm . At 5:27pm while driving home i felt a cold sensation in the back of my neck and back of my throat which began spreading to the back of my head . My heart felt as if I was startled by something. I looked at my smart watch and my heart rate was 145. I began trembling and having abdominal cramping . The back of my head felt like I had swelling or collection of fluid. I opened my windows and began taking slow deep breaths to bring down my heart rate . It took quite a while to get it below 100. I felt as if I was going to pass out. After deep breathing for what felt like atleast 15 to 20 minutes , my pulse came down and I closed my windows . As soon as my body warmed back up in the car , the symptoms returned and my heart rate went back up to 130s , 140s . I had to keep my windows down and deep breathe the entire way home which took an hour . My body was trembling. When I got home I felt as if I was too weak to get out of the car . I still felt that startled feeling in my heart and was afraid of what could happen next . My lips and face were

swollen. My lips were also slightly itchy. I called 911 for help . By the time they arrived my vital signs had stabilized but I still had swelling in my face and lips . My EKG , vital signs and oxygen levels checked out normal so I did not go to the ER. That night I took benadryl and Tylenol. Day 2 post vaccine the collection of fluid or swelling in the back of my head had now spread to the top . That night I had the feeling that my throat was swelling do I took benadryl and Tylenol and my face and lips were still slightly swollen . Day 3 post vaccine I woke up with slightly blurry vision. The swelling in my head now feels like it has encompassed my entire head and have a slight headache. I went to the urgent care requesting an MRI of the head and an epi pen . I was given Medrol dose pack , an RX for epi pen for emergencies and advised to continue benadryl and Tylenol. Day 4 post vaccine, slight headache continues. Slightly blurry vision

Previous Vaccinations: Had the same type of rash/reactions to Chloroquine, which shares the Polyethylene_glycol component with the Covid vaccine

Other Medications: VITAMIN D, C, AND ZINC

Current Illness: I had Covid 19 at the time the vaccine was administered, I tested positive that same night.

Preexisting Conditions: Non

Allergies: I'M ALLERGIC TO DG6 OR MOST LIKELY IODINE, AND TO CHLOROQUINE WHICH HAS Polyethylene_glycol, A COMPONENT OF MODERNA COVID VACCINE. I DID NOT KNOW ABOUT THIS COMPONENT. I WAS ASKED IF I HAD ADVERSE REACTIONS TO COMPONENTS IN THE MODERNA VACCINE BUT I WAS ASKED IF I HAD ADVERSE REACTIONS TO CHOLOROQUINE.

Diagnostic Lab Data: I have them, to large to add here.

CDC Split Type:

Write-up: 1) Skin rash over 80% of my body including, face and lips; started to change my voice sound and started to compromise my airways. 2) Uncontrollable shakes, but not sure if this was related to Covid-19 itself. Was given steroids via injection into my blood stream, within minutes the shakes stopped and within 2 hours the rash was gone.

Previous Vaccinations:

Other Medications: Nature Thyroid, HCTZ, Vitamin D, Multivitamin, Vitamin C, Quercetin, Turmeric, CO Q10

Current Illness: None

Preexisting Conditions: Hypothyroid, hypertension

Allergies: None

Diagnostic Lab Data: None

CDC Split Type:

Write-up: 8 hours after vaccine severe injection site pain/swelling, severe body aches, 101.0 temp. 16 hours after vaccine woke up from sleeping with flushed skin, facial swelling, and throat swelling. I immediately took 100mg of Benadryl and went to hospital emergency room. Approximately 30-40 minutes later symptoms started to lessen. Once at the ER, at the same time symptoms began to resolve, I was given PO Solumedrol and Pepcid. I was monitored and then discharged with RX for prednisone, and EPIPEN (to use if needed). No other issues with allergic reaction. Mild injection site soreness, mild body aches, 99.3 temp persist at 36 hours post injection.

Previous Vaccinations:
Other Medications: Adderall 15 mg xr
Current Illness: ADD, gastric sleeve surgery, chronic sinusitis
Preexisting Conditions: Chronic sinusitis, ADD, history of diabetes but no longer diabetic (as of 2019)
Allergies: None
Diagnostic Lab Data: None, just vital signs at clinic. I did take a blood pressure at home and it was stable and my pulse was high normal for me. (80s)
CDC Split Type:

Write-up: Received shot Wednesday night, developed arm soreness and mild flu like symptoms on left side of my body and facial paresthesias on the left side of my face. Twelve hours later, after waking up those same symptoms were only on the right side of my body. Friday morning, mostly normal physically just with some overall fatigue. Friday afternoon I started to get hives on my chest and overnight into Saturday they were on my lower back, sides, and legs. I took 50 mg of Benadryl every 6-12 hours until Monday mid-day when Benadryl was not helping reduce the hives and so I had full body hives. I did try an drugstore cortisone cream which did not help. Sought treatment at an urgent care as I was feeling anxious and could not control the itching. I and was diagnosed with likely allergic reaction to the covid-19 vaccine.

Previous Vaccinations: red hot swollen with the flu shot that has preservatives

Other Medications: IBU, plaquenil stopped approximately 3 weeks prior to vaccine.

Current Illness:

Preexisting Conditions: Lupus, asthma, allergies, migraines

Allergies: shellfish or anything shellfish derived any fish- anaphylaxis, Imitrex- stroke like reaction, mustard - rash and tongue raw, PCN, Erythromycin, amoxicillin - rash and hives,

codeine - airway narrowed, Benadryl - secondary rash, sulfa - anaphylaxis.

Diagnostic Lab Data: no tests or labs. Was seen in the ED on 1/16/21

CDC Split Type:

Write-up: Felt tachycardia immediately, thought she was anxious. After 35-45 minutes she felt like she was having a hard time swallowing which progressed to tongue swelling, all taste buds popped up and sore, hives on face & neck, reddened face. Itchy neck and face. Took double dose of Atarax and went to bed. Felt extremely fatigued unsure if double dose of Atarax. Woke with swelling all over body. Woke up feeling heaviness as if she had "sumo wrestler" on her body. 24 hours post vaccine heaviness started to lift but felt as if she had a vise on her lungs. Continuing to take Atarax every 6 hours per MD order.

Previous Vaccinations:

Other Medications: Benztrapine Mesylate 1 mg. by mouth twice daily clozapine 50 mg. by mouth daily at 0700 and 1600, 100 mg. daily by mouth at 8 p.m. (200 mg. total daily) Junel 1-20, one tablet by mouth once daily Ativan 0.5 mg. by mouth three times daily

Current Illness: Patient was actively being treated for Bipolar disorder with most recent episode depression, Anxiety disorder, ADHD, Oppositional Defiant disorder, Autism Spectrum Disorder, Fetal Alcohol Syndrome, Intermittent Explosive Disorder, a history of Pseudo-seizures, and insomnia. She has Alopecia Areata, and allergic rhinitis, and constipation. She has a history of left eye strabismus and uses glasses. She has not been acutely ill prior to vaccination.

Preexisting Conditions: See above, history also of right radial neck fracture in 2019 with ORIF repair. Living at Center for behavioral management and stabilization

Allergies: Ideopathic reaction to clonidine and benadryl - Awake for days after use Risperdal causes Aggression No true allergies

Diagnostic Lab Data: Vascular studies venogram with radiology review and interpretation CT of Abd. and Pelvis Left Hip and Pelvis EKG Labs - including coagulation studies Stint insertion into Left Iliac vein

CDC Split Type:

Write-up: One week after the shot (1-14-2021) Patient (19 y.o.) reported side pain and appeared constipated, Laxatives given along with Tylenol, on further assessment Patient was noted to have left leg redness and abdominal fullness. Dr. was updated and we had orders for close monitoring, the next day when she got up, her leg appeared better, and she had passed a small BM, but by lunch she had developed significant pain and edema in her left leg, and the color of her leg was reddened again. She was sent to the emergency room with her symptoms. She was admitted back to our facility yesterday, her diagnoses included Acute

provoked left external iliac, femoral, popliteal, and peroneal DVT. Elevated Factor II levels, Elevated APC resistant, May-Thurner Syndrome, history of developmental disabilities, fecal impaction and urinary retention - suspected related to her fecal impaction. Vascular surgery was consulted, and pt. was started on a heparin drip, and mechanical thrombectomy was needed for both legs due to multiple clots. She was started on Eliquis and Plavix, and thigh high compression stockings were ordered, ace wraps being used until these are supplied. Her Fecal impaction was addressed also and the urinary retention resolved.

Preexisting Conditions: obesity, afib, covid 19 in March 2020

Allergies: No known allergies

Diagnostic Lab Data: ekg 1/15/21 afib 160 heart rate chest xray, evidence of pneumonia- new or related to prior Covid 19 illness in March of 2020? covid 19 and flu test, negative

multiple lab tests

CDC Split Type:

Write-up: a couple hours after the vaccine, I experienced a bit of rapid heart rate, which resolved after a few minutes. The following day around 3 pm I began to have chills and felt like I had the rapid heart rate again. By 5 pm I was beginning to feel really bad, I was freezing, chills and my heart rate was now extremely fast, I was having trouble speaking complete sentences, my husband drove me to the emergency department. I had a very high heart rate and high fever, I was admitted and in the hospital until Sunday afternoon. The diagnosis was pneumonia, I don't really believe this, as I felt fine and had no symptoms prior to the onset of the fever.

Previous Vaccinations:

Other Medications: Cholecalciferol, hydroxychloroquine, propranolol, norethindrone/ethinyl est/fe, folic acid.

Current Illness: None per patient

Preexisting Conditions: HTN, RA

Allergies: Ciprofloxacin, Tramadol

Diagnostic Lab Data: Patient states lab work and EKG performed at ER on Monday 1/18/21 returned "normal"

CDC Split Type:

Write-up: Patient called this nurse stating she had an allergic reaction to COVID vaccination given on Friday 1/15/21. States she felt fine for the 15 minutes post immunization, was on her way home and started feeling dizzy, short of breath, chest heavy, throat felt full "like a ball in it". She came back to clinic which was closed but sat in the parking lot for a while. While in parking lot trying to figure out what to do, her symptoms lessened. She got home safely but started to feel jittery/shaky and her BP was very high (couldnt remember exact number). She then went to urgent care where they told her she was having an allergic reaction and given a pill of something and steroid for 6 days. Went home from urgent care and BP still high but got better at bedtime. Saturday she had a "really bad headache and just layed around all day. I was not able to function at all." Sunday she still had a headache and added muscle aches. Monday she started feeling "a lot better" until 8 PM when she was walking around doing her nightly routine and started to feel a wave of dizziness, throat felt funny so she sat down and took her BP with result of 207/131. Says this reaction felt worse than Friday's reaction so she went to ER where she was again told she was having an allergic reaction and the steroid given to her at Urgent Care was not helping and to stop taking them. Given Benadryl in the waiting room, had labs and EKG which came back "normal", and given a different med Vistaril to take with any future symptoms. Was also told to NOT take the second dose of COVID vaccination. Says she has not had to take the Vistaril yet and has not had any sign of reaction today so far. Said she did report the initial headache on the V-safe app.

CDC Split Type:

Write-up: I am a registered nurse at hospital. On 12/25, seven days after receiving the shot I started to get right lower leg pain and I kept complaining about it till New Years Day. I had no symptoms of a DVT. I triaged on 1/1/21 and the doctors ordered labs/imaging and the results were as followed: D-Dimer biomarker (+) , Ultrasound of the Rt lower leg (-) , CTA showed a PE (segmental right upper lobe pulmonary artery consistent with pulmonary embolus). I was discharged on Xarelto and advised to follow up with a hematologist. On 1/5/2021, I went to hematology and they did a whole bunch of labs. I was sent to get a ultrasound of the leg because the pain persist and they found a clot hidden by my soleus. The plan is to continue on the Xarelto for 6 months. Come back in 3 weeks to scan my leg again and get my lab results. On 1/12/2021, I received the 2nd shot of the Pfizer vaccination.

Other Medications: Losartin

Current Illness: None

Preexisting Conditions: Hypertension Obesity

Allergies: None

Diagnostic Lab Data: 1/20/21 0533 CBC: WBC- 6.9, H/H 11.7/34.0, Platelet count 2 (following transfusion of 1 unit platelets at 2300 1/20/21)

CDC Split Type:

Write-up: The patient was seen in my office on 1/19/21 with complaint of heavy vaginal bleeding. A CBC was obtained which revealed an H/H of 12.2/36.1 and a platelet count of 1 (not 1K, but 1 platelet!) and this was confirmed on smear review. She was immediately sent to the Hospital ED and repeat CBC confirmed the critically low platelet count. She is currently hospitalized and she has received platelet transfusions but her platelet count is still critically low. She is also receiving steroids and immunoglobulin and is under the care of MD (Heme/Onc)

Previous Vaccinations:

Other Medications: melatonin 3mg daily, magnesium 500mg daily, gabapentin 300mg BID

Current Illness: none known.

Preexisting Conditions: lower extremity neuropathy

Allergies: meperidine = hives/dyspnea

Diagnostic Lab Data: Upon arrival to ED on 1/15 patient had CXR and blood work ordered. CXR showed hilar prominence and thickening paratracheal strip - recommended to get chest CT. Labwork revealed extremely low level of platelets, 11,000. Discussed with hematology who concurred it was probably ITP. Advised to admit patient, start prednisone 1 mg/kg/day and IVIG 1 g/kg/day x 2 days. On 1/16 platelets increased to 42,000 and on 1/17 they were 104,000. Patient responded well to treatment and was discharged on 1/17. At discharge plan

for a slow taper of prednisosone over 4-6 weeks, weekly CBC's and PCP prophylaxis with Bactrim. She was advised to f/u with PCP in 1 week and should consider getting lung lesion biopsy when platelet count allows.

CDC Split Type:

Write-up: Patient got her 2nd dose of Pfizer covid vaccine on 1/8. On 1/11 she had intermittent chest pain that lasted a few days and started to notice small purpura rash on left breast. She didn't think much of it but noticed the same type of rash on her pant line and then right thigh. On 1/15 she called Occupational Health who advised her to go straight to the ED.

Previous Vaccinations:

Other Medications: Zolofit; Migravent; Namenda; Full Strength aspirin; Prilosec - off brand; Bustar; Zyrtec - took it that morning only before shot as dr directed

Current Illness: no

Preexisting Conditions: Celiac disease; systemic lupus FLE; raynauld"s; Shogren"s; Kallmans syndrome; exercise induced asthma

Allergies: Nuts; dairy; adhesives; Celiac disease - no gluten

Diagnostic Lab Data: Hooked up to BP monitor; may have done telemetry - and monitor kept buzzing off because my blood pressure kept spiking.

CDC Split Type: vsafe

Write-up: Started itching within (left arm) 15 minutes. They said I was fine and to go back to work. About an hour later, I started breaking out in hives and whole body itching. I went back

in and they gave me to full strength Benadryl and it was not helping and my BP was 190/140 (stroke level) and they tried to bring that down. About 10:15 my face was starting to swell and I was short of breath and 10:30 they took me to ER - and gave me Cortisol shot. And IV fluids. And I was in ER for two hours. They wrote me a prescription for six days for 2 prednisone for every day for one week. The PA saw me at the ER and he prescribed. I went home but couldn't drive home because I couldn't see straight so got a ride home. They tested my O2 levels before they left me. Oxygen was 96. My blood pressure was down to 140/95 - so it was down but still elevated. I still had facial swelling for 3 days. But after three or four days it resolved the face swelling. Had a weakness from the shot and still itching but nothing like it was that day still after the four days. Dr. told me I couldn't get second dose. It was an anaphalactic reaction. Dr - prescribed me an EpiPen in case I have another bad reaction to anything.

Write-up: flushing/ facial flushing; Hives; felt warm; short of breath/ audibly gasping for air; wheeze; throat tightening; throat got so swollen and itchy; throat got so swollen and itchy; could not swallow; This is a spontaneous report from a Pfizer-sponsored program Corporate (Pfizer) Social Media Platforms. A non-contactable consumer reported that a 40-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date were not reported), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunisation. Medical history included food severe allergic reaction to influenza vaccine with eggs preservative. Concomitant medications were not reported. The patient previously took influenza vaccine and experienced severe allergic reaction to the eggs preservative. The patient received BNT162B2 vaccine and informed of prior history of severe allergic reaction to influenza vaccine with eggs preservative. She has previously received flu vaccine without egg without problem. Due to her prior history of severe allergic reaction/ anaphylaxis to another vaccine, in this case flu vaccine with eggs, it was noted to proceed with caution. She was told that the vaccination could be differed until more information became available but opted to proceed with receiving the vaccine and be observed for 30 minutes. The patient developed throat tightening approximately 20 minutes after vaccination. She received EpiPen within one minute of symptoms and was sent to the emergency room immediately in a wheel chair by Nursing staff. She was evaluated in the emergency department and was hemodynamically stable. She was given IV Benadryl and was stable throughout observation. The patient then reported that 40 minutes after injection, her throat and tongue started to feel weird and tight. The pharmacy at her work hospital gave her 25 mg Benadryl and 650mg Tylenol. At about 1 hour 45 minute after injection, her throat got so swollen and itchy to the point that she could not swallow. She went to the nearest emergency room hospital and they administered decadron and Pepcid orally, and Toradol intramuscularly. On an unspecified date, the patient also reported that 5 minutes after the vaccine administration, she developed flushing, hives, felt warm and eventually short of breath. She started to wheeze and was wheeled into the emergency room with complaint of "cannot breathe, while holding throat and thrashing with facial flushness noted." She took two Benadryl and had several epinephrine shots. She was discharged from the emergency room but later that day, she started to feel short of breath again. In the emergency department, she was audibly gasping for air, however had no wheezing, had a normal saturation and normal blood pressure. She had taken another dose of her EpiPen intramuscularly and diphenhydramine 50mg by mouth prior to coming. She was then admitted to the hospital for further observation. While on the floor, she started to feel short of breath again (about 9am on 18Dec2020), which required an "RRT." The patient received another dose of diphenhydramine IV, methylprednisolone 125mg IV and several doses of IM epinephrine and also required oxygen. She was than transferred to an ICU for further care. Outcome of the events was unknown. No follow-up attempts are possible, information about batch number cannot be obtained.

CDC Split Type: USPFIZER INC2021034990

Write-up: Internal brain bleeding 10 days after 1st dose covid vaccine; Brain damage; confused; suffering memory loss; This is a spontaneous report from a contactable Physician (patient). This 39-year-old female patient received the 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) intramuscular on 18Dec2020 14:30 at single dose (lot number: EJ1685) for covid-19 immunisation. Medical history and concomitant medications were unknown. The patient experienced internal brain bleeding and brain damage on 30Dec2020 07:30 after 1st dose covid vaccine. Brain surgery received on 29Dec2020. Events were still recovering. Patient was confused and suffering memory loss on 30Dec2020 07:30. Events resulted in Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care, Hospitalization, Prolongation of existing hospitalization (vaccine received during existing hospitalization), Life threatening illness (immediate risk of death from the event), disability or permanent damage. Days for hospitalization was 16. The patient received treatment for events as brain surgery due to internal brain bleeding. The

patient was not pregnant. The patient had no COVID prior vaccination, no COVID tested post vaccination. Outcome of the events was recovering.; Sender's Comments: The reported internal brain bleeding and brain damage with confused and memory loss more likely represented intercurrent disease, and less likely causally related to 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE). The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Diagnostic Lab Data:

CDC Split Type:

Write-up: After the required wait period of 15 minutes I started to drive back home which is 77 miles from the hospital that administered the vaccination. Around 15 minutes down the road I started feeling like something was caught in my throat and was coughing a little. At that time I decided to turn around and go back to the hospital. I took an oral Benadryl 25mg and decided to wait in my car and see if it was something else. After 30-45 minutes I took a drink of water and realized I was having trouble swallowing. I then preceded into the ER and was admitted immediately. In the ER, they started an IV, administered Benadryl, methylprednisolone and a bag of saline. The physician discussed with me and we agreed to hold the Epinephrine to see how I reacted to the previous medications. I was then monitored for a couple hours then released with a prescription of Prednisone 60mg for 5 days and an EpiPen. One day out, no new symptoms besides injection site pain.

Diagnostic Lab Data: Test Date: 20210117; Test Name: COVID-19 test (Nasal Swab); Test Result: Negative

CDC Split Type: USPFIZER INC2021038272

Write-up: Acute liver injury; This is a spontaneous report from a contactable physician. A 35-year-old female non-pregnant patient received the first dose of BNT162B2 (Pfizer-Biontech Covid-19 Vaccine) intramuscularly, in the right arm, at single dose, on 04Jan2021 at 11:00 AM, for COVID-19 immunisation. The patient had not received any other vaccines within 4 weeks prior to the BNT162B2 vaccine. Relevant medical history included hypertension and drug hypersensitivity to amoxicillin; clavulanic acid (AUGMENTIN). Concomitant medications included labetalol; ascorbic acid, betacarotene, calcium sulfate, colecalciferol, cyanocobalamin, ferrous fumarate, folic acid, nicotinamide, pyridoxine hydrochloride, retinol acetate, riboflavin, thiamine mononitrate, tocopheryl acetate, zinc oxide (PRENATAL VITAMINS) and cetirizine hydrochloride (ZYRTEC). On 10Jan2021, at 12:00 AM, the patient experienced acute liver injury and hospitalization was required (duration of hospitalization: 1 day). Treatment was received (supportive care for acute liver injury). Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has been tested for COVID-19 (Nasal Swab) on 17Jan2021. Covid test result: negative. The adverse event was assessed as serious (Hospitalization, Life threatening illness). Clinical outcome of the adverse event was unknown at time of this report. Information on Lot/Batch number has been requested.; Sender's Comments: The information currently provided is too limited to make a

meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

Previous Vaccinations:

Other Medications: Propanolol 80mg every night, Topriamate every night, cyclobenzoprine 10mg at night , Gummy Probiotic, One a day vitamin.

Current Illness: None

Preexisting Conditions: Migraines

Allergies: No known allergies

Diagnostic Lab Data: Labs were drawn , EKG, (COVID 19 screen that was negative 1/19/21.)

CDC Split Type:

Write-up: at 15 mins post injection started to get extremely hot from Right side to left. Then like half of my body was cut head to toe in half and the left side of my body went numb and tingly. I could barely move my extremities. Tounge began to burn like a 9volt battery was being held on it. I was taken to the ER and was told I had a rash on my chest neck and chin. I was treated with Epi IM, Benedryl, famotdine, then had epi again because my tounge felt fat and like a 9volt battery again. Epi went IV second does and had extreme pain with that. Had IV tylenol . Along with IV fluids. For the next 5 days I have had pain in my right harm , shoulder , neck into my head to the tip of my nose. The first 4 days were so bad that I could barely move and would get nauseated and throw up if I moved just right. each day the pains in my right arm,shoulder, neck and head did get better by about 25 percent each day. You could feel it getting better with each day I woke up. I was also having ear pain that seemed to be

worse on 1/19/21. A PA checked my ears and said they were clear. Today, 1/22/21 is the first day I have been able to turn my head without being so sore and feeling nauseated. I was also very fatigued until today, 1/22/21. My hips and lower body are sore today and upper body seems to be less sore by 75%. I still am numb at times in my feet and fingers but can turn my head a lot better today.

Current Illness: NA

Preexisting Conditions: HTN, COPD, Hyperlipidemia, dementia

Allergies: NKA

Diagnostic Lab Data: Nurse provided the following update: Resident diagnosed with bilateral pulmonary emboli via angio CT. Resident admitted with elevated lactic acid levels and a rising troponin level (0.36 @ 0215; 0.45 @ 0800). Resident given IV fluids in the ER and was

currently on 4 L/min O2. Nurse indicating that daughter was being kept informed.

CDC Split Type:

Write-up: 1840 NSG staff notified that resident had fallen and was unable to get up. Upon arrival to resident, resident was lying on her right side outside of her room. Resident was severely diaphoretic and unable to state what had occurred. Resident had a blue tinge to her lips, wheezing bilaterally, equal strength bilaterally and very weak. BP 143/74, HR 66, O2 80%, temperature unable to read temporarily due to diaphoresis. respirations equal and labored at 22 breaths per minute. EMS called. RN and CNA staff stayed with resident while waiting for arrival of EMS. During this time, son called resident's phone and he was updated of the situation. Upon EMS arrival at 1700, resident was regaining orientation and was no longer diaphoretic. EMS bs was 143. O2 placed on resident by EMS with 12 lead to be done on transport. EMS left with resident at approximately 1907. SJH ED called and given report to RN. DON notified.

Other Medications: Diltiazem 120 mg bid, Metoprolol 25 mg qd, Lisinopril 10 qd, Clopidogrel 30 qd, ASA 81 mg qd, Metformin 500 mg bid, Pioglitazone 30 mg qd, L thyroxine 88 mcg qd, Ezetimibe 10 mg qd, Silodosin 4 mg qd; Centrum Silver Multivitamin 1 qd, and

Current Illness: No acute illness. H/O Diverticulosis August 2020

Preexisting Conditions: Chronic illnesses: Aortic Stenosis post TAVR 11/4/2020; Hypertension controlled, mild hyperlipidemia, diabetes mellitus with Hgb A1C of 5.8% and FBS 90"s, hypothyroidism,

Allergies: None known

Diagnostic Lab Data: HgB 8.7 dropping to 8.1 after 4 hours and 4 units prbc, and 2 units platelets at adm 101k, coag tests normal PT PTT, INR Abd CT with contrast showed diverticulosis some hyperemia, subsequent interventional radiology with contrast was unremarkable for celiac, superior mesenteric and inferior mesenteric with hyperemia. Subsequent upper GI endoscopy normal and several days later when patient stable colonoscopy showed diverticulosis only w/o diverticulitis. 3 days in Intensive care unit, large bore IV"s, fluid and metabolic adjustments. Admitted 1/14 pm discharged 1/19 early afternoon with Hgb with 1 added PRBC was 9.2 g/l Dx Thrombocytopenia and presumed diverticular bleed but un proven

CDC Split Type:

Write-up: Acute Gastrointestinal Bleeding per rectum with massive bloody diarrhea, transfer to Emergency room by EMS with IV placement and fluid resuscitation, vital signs unstable, emergency assessment and massive transfusion over next 4 hours of 4 units of PRBC and 2 units platelets, dual 16 gauge IV"s, intrarterial line. ER Summary available and can be scanned and sent. Low HgB, Low platelets in 60 k range and multiple consultants and diagnosis

Current Illness:

Preexisting Conditions: Migraines Back pain Psoriasis

Allergies: sulfates in foods (preservative)

Diagnostic Lab Data: 1/14/2021 - Emergency room visit - Labs for further blood monitoring (continuing and referred to hematology with upcoming appointment, for further care). Labs indicated platelet count of 88,000. 1/14/2021-EKG 1/14/2021-Chest x-ray 1/14/2021- CT with contrast to rule out embolism due to shortness of breath and D-dimer elevation. Normal

CDC Split Type:

Write-up: Within 20 minutes I experienced extreme shortness of breath that continued throughout the weekend and into the following week. Within 36 hours I developed a "rash" that was later diagnosed as petechiae. Labs were ordered immediately and my platelet level was 66,000. The hematologist that was consulted with had me report to the emergency room for further tests. I was informed not to injure myself in anyway with a count that low or I could hemorrhage and die.

I called the medical professional over and they brought me into a staged area for triage. My blood pressure was 171/ 104 or

114. I had chest pain. The EMT did and EKG, listened to my heart, and started an IV. The ambulance was called and I was transported by ambulance to the hospital. At the hospital another EKG was taken, blood pressure and blood work. Repeated blood work was taken. I was admitted to the hospital due to elevation of tyoponin level and chest pain. The following day 1/22/21 I saw my PCP and he thought it was related to the vaccine and recommended a cardiologist for the increased levels of tyoponin and chest pain. The cardiologist performed another EKG< more blood work and performed a cardiac catheterization and a ECO. Both were normal. Prior to that I was given a nitro pill as my chest pain was between a 7 and a 8; a few minutes later the nurse asked about my pain level and it was a 3-4. I was given another nitro pill and shortly after I felt extremely faint and my blood pressure was 56/32. I was immediately given a bolus of saline IV . The chest pain continued through the day. The following day, I had no further chest pain, my tyoponin levels returned to normal and I was released from the hospital.

Diagnostic Lab Data: As above.

CDC Split Type:

Write-up: Uncertain if this was the Pfizer or Moderna COVID vaccine, patient doesn't remember. He thinks he got it at pharmacy. Patient is a 79 year old man with COPD on chronic 3LPM oxygen who developed chills, myalgias and trouble breathing about 18-24 hours after his first dose of COVID vaccine. He held out for a week outside the hospital before coming in to be admitted on 1/24/2021. Found to have increased oxygen requirements to 6LPM and new bilateral left lower lobe and right lower lobe pulmonary opacities, L side worse than R. Patient is afebrile, tachypneic, and mildly tachycardic with normal blood pressure. Imaging consistent with multifocal pneumonia. Patient's labs are significant for elevated white count to 13, with neutrophil predominance, normal absolute lymphocyte count. Basic metabolic panel unremarkable. Influenza A and B PCR are negative, Cepheid SARS-COV2 PCR was negative. Troponin BNP and EKG are normal. Patient was admitted to the ICU on 1/24/2021 and started on rocephin and azithromycin for community acquired pneumonia. He was also treated with duoneb inhalers and IV methylprednisolone, though it's not clear to me he was in COPD exacerbation with wheezing while he was in the ER. He is currently still only a few hours into his hospital stay and is in stable condition, though still requiring 6LPM O2 up from his baseline of 3LPM.

Current Illness:

Preexisting Conditions: Medical History/Concurrent Conditions: Anxiety

Allergies:

Diagnostic Lab Data: Test Date: 20210104; Test Name: Echocardiogram; Result

Unstructured Data: No cardiac function issue, Mitral Valve filing defect.; Test Date: 20210104; Test Name: Troponin

CDC Split Type: USMODERNATX, INC.MOD20210

Write-up: High Troponin Levels; Felt dizzy; Chest felt tight; Mitral valve filling defect; Difficulty breathing; Concern of anaphylaxis; Passed out unconscious; A spontaneous report was received from a physician concerning an approximately 28-year-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced the events, felt dizzy, chest felt tight, difficulty breathing, passed out unconscious, concern of anaphylaxis, non-ST segment elevation myocardial infraction, high troponin levels, and mitral valve filing defect. The patient's medical history as provided by the reporter included a history of anxiety. Concomitant medication use included sertraline, buspirone, acyclovir, propranolol, hydroxyzine and lorazepam for unknown indications. On 04 Jan 2020, prior to the onset of the events, the patient received her first of two planned doses of mRNA-1273 (Lot number: 011L20A, Exp. date: 03 Jul 2021) intramuscularly, in her left deltoid, for prophylaxis of COVID-19 infection. On 04 Jan 2020, a couple of minutes after receiving the vaccine, the patient experienced dizziness, chest felt tight, difficulty breathing, and she passed out unconscious. Due to concern of anaphylaxis, while the patient was still unconscious, she was treated with epinephrine followed by intramuscular injection of cetirizine hydrochloride. In addition, ammonia salt was used. The patient woke up briefly and passed back out. Emergency medical services (EMS) arrived and almost had to intubate the patient. The patient stayed overnight in the hospital due to lab values indicating non-ST segment elevation myocardial infraction, high troponin levels, and a mitral valve filing defect. It was noted that the patient has never had an allergy to anything, including the excipients in the Moderna vaccine. In addition, the patient had no history of loss of consciousness or anaphylaxis. Relevant laboratory tests conducted included an echocardiogram which found no issues with cardiac function and noted a mitral valve filling defect. Action taken with mRNA-1273 in response to the events was not reported. The outcome of the events, felt dizzy, chest felt tight, difficulty breathing, passed out unconscious, concern of anaphylaxis, non-ST segment elevation myocardial infraction, high troponin levels, and mitral valve filing defect was unknown.; Reporter's Comments: This case concerns a 28 year old female patient with medical history anxiety who experienced Concern of anaphylaxis , high troponin levels, dizziness, chest discomfort, difficulty breathing, loss of consciousness and Mitral valve filling defect same day after administration of the first and only dose of the mRNA-1273 (Lot number: 011L20A, Exp. date: 03 Jul 2021). Based on temporal association between the use of the product and the start date of the reported events and the absence of any other etiology factors, a causal association cannot be excluded.

CDC Split Type: USPFIZER INC2021035498

Write-up: fever/102.3 temperature; headache; achy all over; Within 3 minutes had tingling pins in mouth tongue and throat; Within 3 minutes had tingling pins in mouth tongue and throat; had hard time breathing; O2 sat were at 91; i had High BP 148/92; severe fatigue; This is a spontaneous report from a contactable Other HCP (patient). This 52-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number=EJ1686), via an unspecified route of administration on 05Jan2021 07:00 at single dose on the left arm for COVID-19 immunization. Medical history included attention deficit hyperactivity disorder (ADHD), asthma, depression, irritable bowel syndrome (IBS), known allergies included bacitracin, penicillin, levofloxacin (LEVAQUIN), metronidazole (FLAGYL), oseltamivir phosphate (TAMIFLU), Bees, Hornets. Patient took other medications in two weeks. No other vaccine received in four weeks. Patient was not pregnant. Facility type

vaccine was hospital. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient hasn't been tested for COVID-19. On 05Jan2021 07:03, within 3 minutes patient had tingling pins in mouth tongue and throat, had hard time breathing. The nurses gave her 50 mg of diphenhydramine hydrochloride (BENADRYL). The doctors checked her O2 sat were at 91, and she had High BP 148/92. After 40 minutes (05Jan2021 07:43) after the medication her symptoms seem to go away and she could breath better. She went home and went to bed because she work night shift. She got the vaccine when she got off work, then about six hours later (05Jan2021 13:00) she had bad headache and achy all over, 12 hours later (05Jan2021 19:00) she had 102.3 temperature and took paracetamol (TYLENOL) every 4 hours and fever finally broke 26 hours later (06Jan2021 21:00). She continued to have a headache for about 5 days and severe fatigue. Adverse event resulted in life threatening illness (immediate risk of death from the event). Patient was recovered with lasting effects.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported life threatening events including tingling pins in mouth tongue and throat, had hard time breathing, PO2 decreased, blood pressure increased, bad headache, achy all over, fever, and severe fatigue, and the administration of the COVID 19 vaccine, BNT162B2, considering the plausible temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

Pregnant; Surgery

Allergies:

Diagnostic Lab Data:

CDC Split Type: USPFIZER INC2021042619

Write-up: Pain through whole body and tremoring; Pain through whole body and tremoring/ whole body was sore; Things started looking funny/ Funny feeling in her ears; Deaf and couldn't hear; Leg cramps in both legs and toes curled out/ muscle spasming; Dizzy; nauseous; Threw up twice; Bruise at injection site; This is a spontaneous report from a contactable nurse (patient). A 60-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Batch/lot number: EL3246) via an unspecified route of administration on the arm left on 05Jan2021 around 12:00 PM at single dose for COVID-19 immunization. The patient used to get legs cramps when she was pregnant with her twins, but it was only one leg. The patient stated she delivered six children, was in car accidents, and had surgeries. And the patient stated the pain from the COVID-19 Vaccine was beyond any other pain she has experienced. The patient needed glasses to read patient card. And stated her eyesight was going. The patient was pretty healthy. There were no concomitant medications. The patient had no prior vaccinations within 4 weeks. And the patient did not receive additional vaccines on same date that administered BNT162B2. The patient experienced deaf and couldn't hear on 06Jan2021 09:00, leg cramps in both legs and toes curled out on 05Jan2021 19:00, dizzy on 05Jan2021, nauseous on 05Jan2021, threw up twice on 05Jan2021, things started looking funny on 06Jan2021 09:00, pain through whole body and tremoring on 06Jan2021 10:00, bruise at injection site on Jan2021. All the events (except for event bruise at injection site) were reported as seriousness as life threatening. Clinical course: the patient worked nightshift. Laid down that afternoon to take a nap and got up around 10:00. Around 05Jan2021 19:00 PM had sever leg cramps in both legs where her toes were curled out. Leg cramps after vaccine wouldn't go away and it was in both legs. Just wouldn't go away. Around 05Jan2021 21:00 PM it went away. The patient was dizzy, nauseous, and threw up twice on the night of 05Jan2021, and going into 06Jan2021. The patient went to the couch in the hotel room and started going deaf. She couldn't hear anything on 06Jan2021 around 09: 00 AM. Things started looking funny on 06Jan2021 around 09: 00 AM. Woke up at 09:35. Hour after that there was pain through her whole body and everything was hurting at 10:00 AM on 06Jan2021. The patient was tremoring at 10:00 AM on 06Jan2021. Couldn't reach the phone to dial 9-11. Thought she was going to die. Last until about noon and then started to go away. Doesn't know if it is safe to take the second vaccine. Doesn't know if these are thing that should have happened to her. She started to get real concerned. Went into hotel room and started feeling dizzy again. Stopped haring things. Funny feeling in her ears. Was seeing things, got dizzy, and everything got dark. Everything lasted until 12:00 PM on 06Jan2021. Everything was good now. The patient had a bruise where injection was in Jan2021. Stated it was nothing compared to what she went through. Woke up around 10:00 AM. Then went back to sleep and got up around 18:00 PM. She felt fine. Her whole body was sore from the muscle spasming. The outcome of the event bruise at injection site was unknown, of the event leg cramps in both legs and toes curled out was recovered around 05Jan2021 21:00, the outcome of other remain events was recovered on 06Jan2021 12:00. The reporter considered (method of assessment: Global Introspection) that

all the events were related to BNT162B2.; Sender's Comments: All the reported events were possibly related to the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), due to temporal relationship. However, it is worth noting that the 60-year-old female patient had car accidents history and had surgeries. All the events started when she worked nightshift, including leg cramps in both legs and toes curled out, nauseous, threw up twice, pain through whole body, tremoring and transient deafness. Patient did not get rest after vaccination may a risk factor to the onset of the events. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

CDC Split Type: USPFIZER INC2021051703

Write-up: Acute pancreatitis with sepsis; Acute pancreatitis with sepsis; This is a spontaneous report from a contactable pharmacist, the patient. A 48-year-old non-pregnant female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EK5730), via an unspecified route of administration on 17Dec2020 at 15:00 (at the age of 48-years-old) as a single dose for COVID-19 immunization. Medical history included penicillin allergy. Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medications included fexofenadine (MANUFACTURER UNKNOWN). The patient did not receive any other vaccines within four weeks prior to the vaccination. On 28Dec2020, the patient experienced acute pancreatitis with sepsis, which were reported as serious for hospitalization and being life threatening. The patient had gone to the emergency room due to the event and was hospitalized for a total of 6 days. On 29Dec2020 and 31Dec2020, the patient had COVID-19 nasal swabs performed and both results were negative. Therapeutic measures were taken as a result of acute pancreatitis with sepsis and included gall bladder removal. The clinical outcome of acute pancreatitis with sepsis was recovering.; Sender's Comments: Based on the temporal relationship, the association between the events pancreatitis with sepsis with BNT162b2 can not be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

CDC Split Type: USPFIZER INC2021049231

Write-up: Anaphylaxis; Persistent cough; This is a literature report where authors reported 21 cases listed in table 1. This is the 20th of the 21 patients. This report summarizes the clinical and epidemiologic characteristics of case reports of allergic reactions, including anaphylaxis and nonanaphylaxis allergic reactions, after receipt of the first dose of Pfizer-BioNTech COVID-19 vaccine during December 14-23, 2020, in the United States. As of 23Dec2020, a reported 1,893,360 first doses of Pfizer-BioNTech COVID-19 vaccine had been administered and reports of 4,393 (0.2%) adverse events after receipt of Pfizer BioNTech COVID-19 vaccine had been submitted to the Reporting System. Among these, 175 case reports were

identified for further review as possible cases of severe allergic reaction, including anaphylaxis. Anaphylaxis is a life-threatening allergic reaction that does occur rarely after vaccination, with onset typically within minutes to hours. Twenty-one cases were determined to be anaphylaxis (a rate of 11.1 per million doses administered), including 17 in persons with a documented history of allergies or allergic reactions, seven of whom had a history of anaphylaxis. The median interval from vaccine receipt to symptom onset was 13 minutes (range = 2-150 minutes). Among 20 persons with follow-up information available, all had recovered or been discharged home. A 29-year-old female patient who received the 1st dose of the bnt162b2 (BNT162B2 vaccine, unknown lot number) at single dose in Dec2020 for covid-19 immunisation. Medical history included allergy to sulfa drugs. The patient had no prior history of anaphylaxis. The patient's concomitant medications were not reported. The patient experienced anaphylaxis (signs and symptoms: generalized urticaria) and persistent cough, 54 min after vaccination, in Dec2020. It was determined to be Brighton level 2 of diagnosis. The patient received treatment at emergency department and received treatment with epinephrine. At the time of the report, the outcome of the events was recovered. Information on the lot/batch number has been requested.; Sender's Comments: A possible contributory role of the suspect products cannot be excluded for the reported event anaphylaxis based on the known safety profile and temporal association ,Linked Report(s) : US-PFIZER INC-2021043915 same article/drug, different patient;US-PFIZER INC-2021043908 same article/drug, different patient;US-PFIZER INC-2021043909 same article/drug, different patient;US-PFIZER INC-2021043916 same article/drug, different patient;US-PFIZER INC-2021043911 same article/drug, different patient;US-PFIZER INC-2021043910 same article/drug, different patient;US-PFIZER INC-2021043912 same article/drug, different patient;US-PFIZER INC-2021043913 same article/drug, different patient;US-PFIZER INC-2021043914 same article/drug, different patient;US-PFIZER INC-2021043597 same article/drug, different patient

Allergies:

Diagnostic Lab Data: They have carried out Multiple Blood and Radiology Test as stated below. As per Doctors, all of my Test results are Normal, and they did not find any sign of Stoke and Heart Attack.

CDC Split Type:

Write-up: Following are my symptoms and severe side effects and events after receiving the COVID-19 Vaccine. 1- Receive COVID 19 vaccine at 4.00 PM on 01/15/21. 2- Stay about 20 minutes after Vaccination and observe no reactions and symptoms. Dive back home. take dinner and sleep well whole night. 3- Next day morning when I wake up feel till bit of Nausea/Vomiting. 4- Take breakfast at about 10.00 AM and after that feeling of Nausea got increased and i also start feeling weakness. These symptoms remains all day. 5- At about 5.15 PM I went to take Shower. After about 2 minutes during shower, i feel shortness of Breath,pressure on chest and Dizziness 6- These Symptoms was for about 4 to 5 second and goes off. 7- After about one minute I feel second time shortness of Breath, pressure on chest and Dizziness. It was bit intensive and for a longer period for about 10 second. 8- At this point I realized that this is something serious happening to me. 9- I came out from the Vertical Shower and called my wife that I am not feeling well. She was at this time at first floor. 10- I think it is about 1 minute after when I came from shower, I feel third time shortness of Breath, pressure on chest and Dizziness. I was very severe and within a second or so I passed out and fell down into the Jacuzzi which is beside the Vertical Shower. 11- Within a minute, my wife and my son came to the scene. At this time my wife finds me unconscious with my eyes open. 12- She shouted my name and then I came into my senses and told them to get me out of Jacuzzi. 12- My wife and my son get me out and carried over to the bedroom. I was feeling no shortness of Breath and Dizziness but mild pressure on chest, shivering and chill. 13- Thanks GOD I did not get any body injury except little bit of hit at my Neck and back of the Head. 14- My wife immediately called to my Primary Care Nurse and then I talk to her explain the whole situation and then asking for advise. 15- She advise me to go to any near Hospital Emergency for any urgent Medical care. 16-A about 6.00 PM I went to Emergency. At this time I was feeling Nausea and Shortness of breath. 17- The Nurse immediately check my blood pressure, temperature, oxygen and pulse. These all was normal. Nurse also provide me IV medicine for Nausea. 18- During my stay at Emergency, I again feeling mild tightness/pressure in chest beside shortness of breath and shivering, therefore Emergency Doctor advise me that will admit to the hospital and do the complete check of any stroke and heart attack. 19- I was in the Hospital for 2 nights. During this stay I was under care of: - Attending Physicist: -Cardiology Physician 20- They have carried out Multiple Blood and Radiology Test as stated below. As per Doctors, all of my Test results are Normal, and they did not find any sign of Stoke and Heart Attack. -Multiple Blood Lab test. -XR CHEST 1 V -CT C-SPINE WO CONT. -CT HEAD-BRAIN WO CONT. -CT ANGIO HEAD W&WO CONT. -CT ANGIO NECK W&WO CONT. -CTA CHEST FOR PE -MRI BRAIN WO CONTRAST . - STRESS TEST. 21- I was discharge from the Hospital on 01/18/21 at 17.34.

Previous Vaccinations:

Other Medications: prenatal vitamin

Current Illness:

Preexisting Conditions:

Allergies:

Diagnostic Lab Data: On presentation to local ER at approx. 19:15 on 01/13/21, vitals were stable. Hematocrit was noted to be 31.9, down from 39.6 on 12/30/2020. CT abd/pelvis showed a large amount of hemoperitoneum throughout the abdomen and pelvis, with a 8.9cm heterogeneous masslike area in the left hemipelvis/adnexa, most compatible with a hematoma, and active extravasation of contrast within the center of the hematoma, compatible with active bleeding. Transient hypotension to 69/35, so 1L IVF and 2 units PRBCs given. Transferred to another hospital at approx. 00:30am on 01/14/21 and underwent partial gelfoam embolization of the bilateral uterine and right ovarian arteries. Hospitalized for 2 days. Hematocrit remained stable.

CDC Split Type:

Write-up: Began medication (follitropin 200 units) for assisted reproductive technology on evening of 01/02/21. Added ganirelix injections on 01/06/21. Trigger injection with leuprolide administered at 20:00 on 01/11/21. Immediately prior to oocyte retrieval on 01/13/21, given 1L IVF and ampicillin (dose unknown) at approx. 07:30am. Retrieval at 08:00am was uneventful, but notable for 17 oocytes retrieved and only 10 were mature. Post-procedure vitals were WNL. Discharged home from facility (Family Health Center) at approx. 09:30am. At approx. 12:00pm, noted increasing abdominal girth. At approx. 14:00, noted mild shortness of breath. Abdominal distention and shortness of breath continued to worsen. Unable to recline even moderately due to difficulty breathing.

Preexisting Conditions: Hx. of assault causing subdural hematoma/TBI and Craniotomy 10/7/2020. Cranioplasty done 11/11/2020. Cognitive impairment Hx of drug and alcohol abuse

Allergies: NKDA. Some intolerance to food with dairy in it.

Diagnostic Lab Data: Please check with Hospital to see all the exact tests that were done.

Many tests were done while in the ICU including the emergency craniotomy. This resident is still in the hospital. He was extubated this morning. He is stable enough to transfer to a med floor.

CDC Split Type:

Write-up: 1/22/2021 this resident was found on his kitchen floor having severe Grand Mal seizures and was profusely foaming from the mouth. RN (writer) responded to the emergency. Resident had 8 seizures between the time of calling 911 and them arriving. They had been IV pushing Ativan and Versed. The seizures did not stop. He was rushed to Hospital, intubated, placed on life support and admitted to the ICU. Resident had an emergency craniotomy and they did not find any infection or cause of the seizures. Many other tests were done and nothing was determined to be the cause at this time. Reported to ICU nurse on 1/23/2021 that resident had received the Moderna vaccine a couple days prior.

Current Illness: Received first COVID vaccine on December 23, 2020 Second COVID vaccine Jan 20, 2020 MODERNA brand

Preexisting Conditions: Platelets did drop to 55-115 last year (December 2019). Vitamin B12 was started which brought them from 55 to 112 or so. Positive anti-platelet antibodies were detected. Never required more than vitamin B12.

Allergies: Penicillin and Zithromax (confirmed by allergy testing)

Diagnostic Lab Data: 1/22: CBC, CMP- Platelets 7 1/23: CBC- Platelets 6 1/24: CBC-

Platelets 60

CDC Split Type:

Write-up: Received second COVID vaccine Moderna on Wednesday evening at 6pm. Later that night, I was a little light-headed and achey, but went to bed. On thursday, my legs and arms were extremely achy. I took Tylenol and Motrin in the morning. It seemed to help some, but continued to feel very achy in my legs. I left work early (I am a pediatrician) on Thursday and went home and just sat and rested. I felt terrible, but had talked to other colleagues who felt very bad that first day after the shot. Friday morning, I woke up still achy but feeling better overall. I took motrin and Tylenol again on Friday morning. I worked the whole day seeing patients. Was tired, but got thru the workday. At around 6pm, I noticed petechiae rash on my lower legs. The rash started spreading thru the night- up my legs and to my arms. I went to ER. They did order CBC, CMP. Platelets were undetectable- 1 platelet was seen under microscope. CMP was normal. I was told to go to bigger hospital. I went, My platelets read as 4. I was admitted for two nights. Two doses of IVIG were given and I was put on Decadron 40mg PO daily for 4 days. I had tylenol, benadryl, zofran before the IVIG and after. I will see Hematology next week for follow up. Platelets yesterday at discharge were 60. Will be checked frequently for the next few months. ITP= diagnosis. COVID shot was trigger.

Previous Vaccinations:

Other Medications: Phenergan; Trileptal; Nortriptyline; Melatonin; Voltaren

Current Illness: None

Preexisting Conditions: Diabetes Mellitus; Asthma; Migraine headaches.

Allergies: Pt denies any allergies to medications. Pt reports as a "teen I was I allergic to citrus, barley, wheat, rice". Pt states "my lips and tongue swelling and I would take Benadryl". Pt reports that she has "since outgrown those food allergies". Pt denies to her knowledge allergies to other products

Diagnostic Lab Data:

CDC Split Type:

Write-up: Per summary of primary hospitalist. Pt admitted for acute hypoxic respiratory failure requiring mechanical ventilation secondary to angioedema from Moderna COVID-19 vaccination. Pt presented with a chief complaint of tongue and facial swelling approximately 10 minutes after receiving first dose of the vaccination. She did not respond to Benadryl or IM epinephrine. She was admitted to ICU and intubated. She was started on IVsteroids, famotidine and diphenhydramine. Swelling gradually improved and she was successfully extubated. Her hospital course was complicated by steroid-induced hyperglycemia requiring insulin.

Write-up: coronary spasm; STEMI COVID vaccine induced; slight 1-2/10 substernal chest pain on/off; fever of 101 to 101.7; diffuse severe muscle aches; tachycardia of 110 to 130; painful lymphadenopathy of the ipsilateral axilla and clavicular lymph node (LN); This is a spontaneous report from a contactable physician (patient). A 45-year-old male patient received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EL0142), via an unspecified route of administration in the left arm on 13Jan2021 at a single dose for COVID-19 immunization. The patient's medical history included benign prostatic hyperplasia (BPH). Concomitant medication included alfuzosin. The patient previously took the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899) in the left arm on 23Dec2020 16:00 at the age of 44 years old for COVID-19 immunization. On 14Jan2021, the patient started having fever of 101 to 101.7, diffuse severe muscle aches, and tachycardia of 110 to 130. Thursday evening (14Jan2021) through Sunday (17Jan2021), the patient also had painful lymphadenopathy of the ipsilateral axilla and clavicular lymph node (LN). Thursday evening (14Jan2021), the patient had slight 1-2/10 substernal chest pain on/off. Friday evening around 23:30 (15Jan2021), the patient had chest pain substernal 7-8/10 that lasted for one hour. The burning sensation was worse with cold air. It resolved with paracetamol (TYLENOL) and ibuprofen. Monday early morning

at 04:00 (18Jan2021), the patient experienced STEMI COVID vaccine induced wherein the patient woke up with 10/10 chest pain and shoulder pain which lasted for 30 to 40 minutes and resolved with paracetamol and ibuprofen. The patient also decided to check blood work Monday morning (18Jan2021) while in the hospital. Trop came back 16.28 ng/ml. This is the old trop not high sensitivity. Normal high is 0.30 ng/ml. The patient went to the hospital. ECG showed ST elevation inferior lead. Left heart catheterization was done. The patient have clean coronaries. No evidence of any atherosclerosis. Echocardiogram showed normal EF. No wall motion abnormality. It was concluded that the patient also had coronary spasm. The patient underwent other lab test and procedure which included nasal swab COVID test showed negative on 18Jan2021. Outcome of the lymphadenopathy was recovered on 17Jan2021, of the chest pain was recovered on Jan2021, of the coronary spasm and STEMI was recovering, while of the remaining events was unknown. The events coronary spasm and STEMI resulted in hospitalization and life threatening illness.; Sender's Comments: The reported coronary spasm with chest pain and suspected STEMI were likely related to the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) due to plausible temporal relationship, and no evidence of any atherosclerosis during left heart catheterization. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Allergies:

Diagnostic Lab Data:

CDC Split Type: USPFIZER INC2021057870

Write-up: Rash; Hives; Throat started to close up; Voice changed/ Functional dysphonia; This is a spontaneous report from a contactable other health professional reporting for herself. A 43-year-old female patient received the 1st dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech, lot# EL1284), intramuscular in the right arm, on 29Dec2020 at 16:42, at single dose, for COVID-19 immunisation. Medical history included diabetes from an unknown date and unknown if ongoing, blood pressure high from an unknown date and unknown if ongoing, anxiety from an unknown date and unknown if ongoing, depression from an unknown date and unknown if ongoing, migraine from an unknown date and unknown if ongoing, drug allergy to triptans from an unknown date and unknown if ongoing. Past drug event included drug allergy to Topamax and Rocephin both from an unknown date and unknown if ongoing. Concomitant medications were not reported. The patient experienced rash on 29Dec2020 at 16:45 with outcome of not recovered, hives on 29Dec2020 at 16:45 with outcome of not recovered, throat started to close up on 29Dec2020 at 16:45 with outcome of not recovered. The patient was given Benadryl and EpiPen and was rushed to the emergency room (ER). The events needed emergency room visit and physician office visit. She was admitted into the hospital for 3 days and received Solu-Medrol and intravenous Benadryl every 6 hours until discharge. The reporter stated that after the reaction her voice changed. She was visited by an otorhinolaryngology (ENT) doctor on 19Jan2021 and she had functional dysphonia. Therapeutic measure included speech therapy. Outcome was not recovered. The patient was not diagnosed with COVID-19 prior to vaccination. Since vaccination the patient has not been tested for COVID-19.; Sender's Comments: Based on temporal association, a possible contributory role of suspect BNT162B2 cannot be excluded for reported events rash, hives and throat tightness. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Current Illness: Pt had strep throat that was treated on January 4, 2021

Preexisting Conditions: hypertension, DM2, GERD, high cholesterol

Allergies: Aspirin

Diagnostic Lab Data: While I don't know/think this stroke was caused by a stroke, I thought it was a reportable event.

CDC Split Type:

Write-up: Patient is a 71-year-old female with PMH of type 2 diabetes, hypertension, hyperlipidemia, cataracts, glaucoma who was transferred from Medical Center as a stroke code after she presented there for right-sided weakness, facial droop and visual changes. Patient was given TPA in the past she was within window and she was then transferred here for further management. Patient's symptoms continue to resolve. She was admitted in the ICU and managed by neuro critical care and neurology. Further imaging including CTA head and neck, MRI brain did not reveal any stroke. An assessment of small vessel disease was made which likely resolved after TPA was given. Patient was assessed by PMR and PT/OT and deemed safe to go home with family care and no restrictions. Echo, telemetry and EKG showed no signs of cardiac involvement. Patient was started Plavix x21 days and chronic baby aspirin. She was also started on Crestor 20 mg daily. Patient is to follow-up with neurology in 3 months as she got TPA. She will also follow-up with her PCP on discharge.

Write-up: Heart event stopped him from breathing; stroke; lack of air; This is a spontaneous report from a contactable consumer, the patient. A 40-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EL3249), via an unspecified route of administration in the left arm on 13Jan2021 (at the age of 40-years-old) as a single dose for COVID-19 immunization. Medical history included nut allergy from an unknown date and unknown if ongoing. Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medications included zolpidem tartrate (AMBIEN) and doxepin (MANUFACTURER UNKNOWN). The patient did not receive any other vaccines within four weeks prior to the vaccination. On 14Jan2021 at 13:00, the patient experienced heart event that stopped him from breathing and the lack of air caused a stroke; all reported as life-threatening. On 14Jan2021, the patient underwent lab tests and procedures which included COVID-19 test which was negative. The patient was treated for the events which included being put on a ventilator and sedation. The clinical outcomes of the heart event stopped him from breathing, lack of air, and stroke, were not recovered.

Previous Vaccinations:

Other Medications: For Hypertension losartan potassium 100 MG Tablet (Cozaar) 1 po qd for blood pressure Chlorthalidone 25 MG Tablet 1 po q AM for blood pressure

Current Illness:

Preexisting Conditions: Hypertension, metabolic syndrome

Allergies: Codeine (Feels goofy), Lisinopril (Cough)

Diagnostic Lab Data: Echocardiogram showing RV strain and Pulmonary CT Angiogram: Pulmonary Arteries: Diagnostic quality: Adequate through the segmental arteries. There are large filling defect/emboli in the distal right pulmonary artery with large emboli extending into the second and third order arteries to the right lower lobe. In addition there are prominent emboli extending into the second and third order arteries of the right upper lobe. There is prominent embolus in the distal left main pulmonary artery with extension into the second and third order arteries of the left upper lobe and the left lower lobe.

CDC Split Type:

Write-up: Large, bilateral, unprovoked pulmonary emboli 3 days after a Moderna first dose vaccine in a patient with no risk factors for DVT or PE and no history of any sort of pro-thrombotic disorder. He is in the hospital and work up is in progress, and so we might find another reason for his PE, but as of now we have no other explanation.

Current Illness: NA

Preexisting Conditions: NA

Allergies: Moderate to severe reaction to mollusks: clams, mussels, etc.

Diagnostic Lab Data: NA

CDC Split Type:

Write-up: Pt received second dose of vaccine and went to the observation area. She was risk stratified into the high risk (30 minute observation) category based on a previous anaphylactic response to shellfish requiring epinephrine. She reported only a minor pruritis after the first dose of the vaccine. While in the observation area she reported auditory exclusion to her male partner, then reportedly went unconscious immediately. Employees working in the observation area were notified and summoned medical assistance. A medical provider (PA) arrived and found the pt supine in the passenger seat and unresponsive. Her pulse was weak and thready. One dose of 0.3mg epi autoinjector was administered to her R lateral thigh at 12:03p

CDC Split Type:

Write-up: Received the second vaccine yesterday 1/27/2021 around 11am. About an hour later started to get hives and took a Claritin. Was at home later in the evening around 5pm and started to have lip/jaw swelling and throat tightening. Called an ambulance and they gave her EPI pen and took over treatment. Ended up getting discharged around 11-12pm last night and told to take prednisone and Benadryl. Around 5am today 1/28 had swelling in tongue and bottom lip swelling. Went back to emergency room and they did similar treatment. Is planning to follow up with her doctor and will be on her prescribed medications for a few days.

Write-up: 5 days after 2nd covid vaccine, I started experiencing severe pain, with pins/needles sensation. Started in plantar aspect of both feet and traveled upwards to my hands, in a matter of hours. Extreme pain in lower back and extremities caused me to go to the ER. Following lumbar puncture and a series of diagnostic tests, I have started on IVIG for Acute Inflammatory Demyelinating Polyneuropathy. This is a subtype of Guillain Barre syndrome, believed to be precipitated by autoimmune response generated from the 2nd covid vaccine. I am now on day 4 of my hospitalization.

Allergies: adhesive tape, sulfa

Diagnostic Lab Data: CBC, CMP, tryptase, IgE latex, IgE cinnamon

CDC Split Type:

Write-up: She received her first dose of Moderna COVID-19 vaccine at 7:30 AM on 1-22-21. At 9:15 AM, she felt lightheaded, her heart was racing, and vertigo. She had a nurse check her blood pressure and it was 101/65 and her heart rate was 138 bpm. She felt presyncopal so she went to the ED for evaluation. By the time she got to the ED, she felt her throat was scratchy, and when she would lie down flat she felt her throat was occluding. She notes that she is s/p tonsillectomy in 12-2020, and considered whether that was playing a role in her symptoms, but she had not had any of those throat symptoms for 1 week prior to getting her COVID-19 vaccine. In the ED, she was given IV medications and IV fluids. ENT was consulted. Her symptoms got better with medications, she is still experiencing some throat dryness but otherwise is feeling back to her usual self. She never had any rash, flushing, itching. She had a little tenderness at the injection site only. She never had any difficulty breathing, lip/eye/tongue swelling, wheezing, coughing, shortness of breath, vomiting/diarrhea/abdominal pain. She did have nausea when she felt vertigo.

Current Illness: COMPLAINT OF SINUS ISSUES AND NON PRODUCTIVE COUGH

Preexisting Conditions: HEART CONDITION

Allergies: SULFONYLUREAS,

Diagnostic Lab Data: UNKNOWN

CDC Split Type:

Write-up: PATIENT EXPERIENCED ISSUES WITH SOME LIP SWELLING AND PRESENTED TO THE PHARMACY ON FRIDAY JANUARY 19TH IN THE MORNING. HE HAD VISIBLE SWELLING ON ONE SIDE OF BOTH LIPS . HE PURCHASED SOME DIPHENYDRAMING 25MG OTC AND LEFT. ACCORDING TO HIS WIFE VIA PHONE TO US (ON JAN 26 6PM) HE HAD BEEN ADMITTED TO THE ER AND WAS ON A VENTILATOR DUE TO SEVERE SWELLING OF HIS LIPS, NECK AND TONGUE. HIS AIRWAY HAD BECOME COMPROMISED AND HE WAS STARTING TO EXPERIENCE NAUSEA AND VOMITING. HE WAS IMMEDIATELY INTUBATED AND PLACED ON A VENTILATOR EVEN THOUGH HE WAS STILL CAPABLE OF BREATHING ON HIS OWN. DRS WERE FEARFUL OF MORE SWELLING AND WANTED TO SEDATE HIM AND BEGIN TREATMENTS.

Diagnostic Lab Data:

CDC Split Type:

Write-up: Got booster shot on Wednesday the 20th, came home and was fatigued. Thursday had horrible headache that would not be relieved with tylenol. I took a plane and arrived at 1130 pm. I went to bed shortly after arriving at my daughters house. Friday morning, I was unable to be woken up and my daughter called 911. I was in a coma. I suffered cardiac arrest during a CT to check for clots. I was resuscitated and put on life support. CT scan for clots, strokes, heart attacks were all clear. I was admitted to the C-ICU and on life support, on the ventilator, and was on 3 different medications at max dosage to keep my blood pressure barely surviving. The doctors told my daughter not to expect me to survive because they had no idea why I was suddenly so ill. A doctor then told my daughter that my kidneys were failing, and my liver was damaged. I also developed a high fever and had a high white blood cell count. They gave me Vancomycin and another antibiotic, and then the next the day a kidney doctor gave me lasix to flush out all of the excess fluid. I woke up on Saturday not knowing what had happened and was completely terrified and confused. My daughter was allowed into the ICU to see me and keep me calm, thankfully. She explained to me what happened. I am

still in the hospital, as they are keeping me for observation and trying to determine if my kidneys will start working properly again. Prior to this, I have only ever had a kidney infection, and I thought before I might have had the start of a UTI. I do have chronic high blood pressure as well, a long term side effect from open heart surgery 10 years prior for an aneurysm, but aside from that I am relatively healthy 50 year old.

CDC Split Type: USPFIZER INC2021063797

Write-up: felt tired; nausea; headache; short of breath; rapid/shallow breathing; rapid/shallow breathing; fast heart rate (100 bpm); low grade fever; felt very weak; pleuralpericardial effusion; pleuralpericardial effusion; This is a spontaneous report from a contactable consumer. A non-pregnant 78-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration in the right arm on 16Jan2021 10:30 at a single dose for COVID-19 immunization. Medical history included allergic to opioids, allergy to fish, cirrhosis with portal hypertension, parkinsonism, heart blockage, type 2 diabetes, depression, early dementia. The patient previously took morphine and experienced drug hypersensitivity. There was unspecified concomitant medication. The patient previously took morphine (MANUFACTURER UNKNOWN) and experienced allergic to morphine. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced felt tired, nausea, headache, short of breath, rapid/shallow breathing, fast heart rate (100 bpm), low grade fever, felt very weak, pleuralpericardial effusion on 16Jan2021. All the events were reported with the seriousness criteria of disability, hospitalization and being life-threatening. The patient was hospitalized for the events for 4 days. After the injection, from 0 to 24 hours the patient felt tired, had nausea, a headache, short of breath then at about 24 hours post injection developed rapid/shallow breathing, fast heart rate (100 bpm) low grade fever and felt very weak. The patient was taken to the emergency room (ER) at 30 hours post injection and it was determined (Xray, CTA & EKG) that she had a pleuralpericardial effusion. She was flown by air life to another ER for treatment. The patient underwent lab tests and procedures on 16Jan2021 which included angiogram (CTA): had a pleuralpericardial effusion; body temperature: low grade fever; electrocardiogram (EKG): had a pleuralpericardial effusion; heart rate: 100 beats per minute (bpm); X-ray: had a pleuralpericardial effusion. The patient had a rapid nasal swab on 17Jan2021 which was negative. Therapeutic measures were taken as a result of the events and included unspecified medications & oxygen therapy. The outcome of the events was recovering. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up.

Preexisting Conditions: Medical History/Concurrent Conditions: Hodgkin's disease

Allergies:

Diagnostic Lab Data: Test Date: 20201225; Test Name: Nasal Swab; Test Result: Negative

CDC Split Type: USPFIZER INC2021069327

Write-up: Rught MCA Stroke; This is a spontaneous report from a contactable nurse (patient). A 39 years old female patient (no pregnant) received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EH9899), intramuscular on 16Dec2020 10:15 at the first single dose at right arm for covid-19 immunisation. Medical history included Hodgkin's disease. Concomitant medication included colecalciferol (VITAMIN D3 1000). The patient experienced rught MCA stroke on 25Dec2020 06:15. Seriousness criteria reported as hospitalization, life threatening. The patient was hospitalized for rught MCA stroke for 3 days. The patient underwent lab tests and procedures which included Nasal Swab: negative on 25Dec2020. The patient received unspecified treatment for rught MCA stroke. The outcome of event was recovered.; Sender's Comments: The subject had medical history included Hodgkin's disease. The reported stroke was more likely an intercurrent disease, and unlikely causally related to the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE). The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Current Illness: None

Preexisting Conditions: Sinusitis annually

Allergies: Hay fever allergies

Diagnostic Lab Data: Left side pneumonia Low blood counts and needed transfusions

CDC Split Type:

Write-up: Feeling normal before the vaccine, with exception of slight cough that Dr said was due to allergies. But then a fever, chills and aches the day after vaccine. Two days after, still febrile and feeling worse and experiencing shortness of breath and lightheadedness. Fatigue, fever and lightheadedness continue for three more days. On the 6th day post-vaccine, taken to ER and admitted to hospital with a pneumonia and blood counts dangerously low. Received 3 blood transfusions and is receiving 2 different IV antibiotics to treat pneumonia. Still in hospital and waiting to see how blood counts go. I can't say the vaccine CAUSED this, but it all happened rapidly, immediately following the vaccine.

Diagnostic Lab Data:

CDC Split Type:

Write-up: Went into anaphylactic shock. Started feeling dizzy and light headed 15 mins after the vaccine was given. At 20 mins my throat felt tighter and it was making me cough trying to get air so they gave me 50 ml of benedryl into my right arm. I started to pass out and my breathing was labored so I was given my epipen and taken to the ER. While I was there I was monitored for 4 hours and given 2 more medications. One was a steroid, I'm unsure on the second.

CDC Split Type: USPFIZER INC2021063702

Write-up: Suffered a massive MCA stroke; This is a spontaneous report from a Contactable Nurse. A 65-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number: EJ1685), intramuscularly in left arm on 12Jan2021 16:00 at single dose for COVID-19 immunization. Medical history included covid prior vaccination. Known allergies: None. The patient's concomitant medications were not reported. The patient previously received the first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# EJ1685), intramuscularly in right arm on 21Dec2020 03:00 PM at single dose for COVID-19 immunization. The patient was not pregnant while receiving vaccine. Facility type vaccine: Hospital. If other vaccine in four weeks: No. Other medications in two weeks: No. The patient suffered a massive MCA (Middle cerebral artery) stroke on 21Jan2021 08:00 after getting second covid vaccine with outcome of not recovered. No history of hypertension, elevated cholesterol or medical issues. No medication being taken. Daily BP (Blood pressure) reading normal. Covid test post vaccination: Nasal Swab-PCR on 22Jan2021 with result negative. If treatment for AE: Unknown. The event was resulted in: Emergency room/department or urgent care, Hospitalization (Number of days hospitalization: 4), Life threatening illness (immediate risk of death from the event), Disability or permanent damage.; Sender's Comments: The event middle cerebral artery stroke appeared 8 days after administration BNT162B2. The Company considers that the event is less likely related to suspect BNT162B2 injection given the weak time association. The status (bleeding or infarction) and cause of the stroke would be helpful for further assessment. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Diagnostic Lab Data: Test Name: cholesterol; Result Unstructured Data: Test Result:200; Test Date: 20200119; Test Name: blood pressure; Result Unstructured Data: Test Result:79/38; Test Date: 20200119; Test Name: EKG; Result Unstructured Data: Test Result:acute myocardial infarction

CDC Split Type: USPFIZER INC2021070078

Write-up: acute myocardial infarction; He was found by his secretary unconscious; feeling unwell; This is a spontaneous report from a contactable nurse. A 68-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: UNKNOWN), intramuscular in the left arm on 19Jan2021 (at 68-years-old) as a single dose for COVID-19 immunization. Medical history included blood cholesterol of 200 (not further specified). The patient did not have any allergies to medications, food, or other products. Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medications included irbesartan (MANUFACTURER UNKNOWN). The patient did not receive any other vaccines within four weeks prior to the vaccination. On 19Jan2020 at 08:00, after the vaccine, that patient was at work and was feeling unwell and the patient was found by his secretary unconscious. An ambulance was called. The patient's blood pressure was 79/38 and electrocardiogram showed acute myocardial infarction. He underwent one stent placement with the remaining arteries normal. He was also started on ticagrelor (BRILINTA), metoprolol (MANUFACTURER UNKNOWN) and atorvastatin (MANUFACTURER

UNKNOWN). The patient immediately improved and was feeling well and resumed exercise. The clinical outcomes of the unconscious, acute myocardial infarction, and feeling unwell were recovering. The events required emergency room visit and were assessed as serious for requiring hospitalization for 2 days and being life-threatening. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.; Sender"s Comments: There is not a reasonable possibility that reported events acute myocardial infarction, unconsciousness and feeling unwell are related to BNT162B2. The events are more likely intercurrent medical condition for this elderly patient. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Diagnostic Lab Data: Dr. told me to take Benadryl and not take the second Pfizer shot, not to take any vaccine for two months.

CDC Split Type:

Write-up: On the two hour ride home, my arm would ache then be fine. I was cranky, not myself, going to bed, I woke several times as I rolled over onto my right arm. When I awoke early, I was swollen from Head to Toes, my eyes were slits, my bracelets and rings were swollen into my skin, and my toes and ankles were large. AND I was grouchy about everything. As the day went on I was just mad about everything, I began to drink lots of water and tried to exercise to get the swelling down. About noon, my eyes and face began to ease, but my body didn't ease till about 2pm, as my rings and bracelets were movable then. I am still swollen and still angry and it is Friday.

Current Illness: COVID infection 12/8/21

Preexisting Conditions: glaucoma, diabetes, hypothyroidism, hyperlipidemia, elevated PSA, BPH, Lumbar DDD, ED

Allergies: none

Diagnostic Lab Data: Work up at Hospital revealed progressive respiratory failure and pneumonia requiring intubation and progressive ascending weakness and sensory loss without upper motor neuron changes. MRI : nerve root enhancement LP : protein 40, +/- 80 lymphocytes, cultures negative B 12 and B6 normal extensive CSF testing still pending campylobacter and Musk antibodies negative Neurology diagnosed likely AIDP (Guillain-Barre) and an EMG is planned for the near future. His progression and physical exam were classic for GBS Neurology felt the cause of his GBS was likely his covid infection verses his Moderna vaccination He was treated with plasmapheresis.

CDC Split Type:

Write-up: Client developed a mild covid infection 12/8/21 and recovered. He was admitted 12/25 with hypoglycemia and mild weakness and sent home He was given his first dose of the Moderna vaccine 1/4/21 at approximately 9AM covid vaccine clinic He developed weakness the next day (1/5) prompting admission to a hospital and then transition to subacute rehabilitation briefly Work up at hospital revealed progressive respiratory failure and pneumonia requiring intubation and progressive ascending weakness and sensory loss without upper motor neuron changes. MRI : nerve root enhancement LP : protein 40, +/- 80 lymphocytes, cultures negative B 12 and B6 normal extensive CSF testing still pending campylobacter and Musk antibodies negative Neurology diagnosed likely AIDP (Guillain-Barre) and an EMG is planned for the near future. Neurology felt the cause of his GBS was likely his covid infection verses his Moderna vaccination He was treated with plasmapheresis. Client received dexamethasone, remdesivir, and zosyn and doxycycline when progressive leukocytosis and procalcitonin elevation was noted. Candida was cultured from tracheal aspirates but felt most likely d/t colonization with an option to treat further if he did not continue to improve. He is now extubated, unable to swallow and has profound weakness and distal sensory loss. He will transition to Acute rehab in the near future. Comorbidities:as described in the above section and... DM2, CKD3, HTN, DJD, BPH (h/o prostate surgery), h/o Lumbar surgery and hernia repair, GERD, hypothyroidism, hyperlipidemia. Possible etiologies of his AIDP (GBS) would include his recent covid infection, the Moderna Vaccine, or other undiagnosed infection. He got his flu shot 9/25 (fluzone sanofi) so this is not likely to be the culprit

CDC Split Type:

Write-up: On day 04 After receiving the 2nd Covid 19 Pfizer vaccine, I experienced a deep pain in my upper inner right thigh around 0600 am of the 16th of January. At the same time my calf muscle of that same right leg was in pain. I thought it to be muscular pain as I was told by the reading material regarding symptoms of the covid 19 vaccine there could be aches and pains attributed to the 2nd shot. I used a deep heating rub on both areas of my right leg and put heat on them to treat the soreness. This occurred over the next few days feeling this pain in my right leg and treated the same way applying heat. Within about 24 hours of the pain in my legs I started experiencing a shortness of breath while walking up and down stairs. On day 04 After receiving the 2nd Covid 19 Pfizer vaccine, I experienced a deep pain in my upper inner right thigh around 0600 am of the 16th of January. At the same time my calf muscle of that same right leg was in pain. I thought it to be muscular pain as I was told by the reading material regarding symptoms of the covid 19 vaccine there could be aches and pains attributed to the 2nd shot. I used a deep heating rub on both areas of my right leg and put heat on them to treat the soreness. This occurred over the next few days feeling this pain in my right leg and treated the same way applying heat. Within about 24 hours of the pain in my legs I started experiencing a shortness of breath while walking up and down stairs as part of my daily activities. The symptoms of shortness of breath only seemed to appear when I was on any form of extended walking activity or physical movements or exercise this would have been starting around the 17th of January. The right leg pain was masked by the heating rub while the shortness of breath continued for the next few days. On the 19th of January, I went to an Urgent Care Facility at 0800 am to see a Medical professional to discuss my symptoms I was previously experiencing and to figure out why I was having a shortness of breath and the pain in my right leg. The on staff Physician's Assistant had a Nurse conduct a Covid 19 Rapid test (negative) and a second swab was administered and sent to the Lab. Which produced a (negative for Covid 19) on the 20th of January. An Xray was not taken to determine my shortness of breath. The Dr listened to my lungs and heart, though I did let the PA know I had received both Pfizer shots and when they were administered. I was carrying My Shot record for the vaccine with the dates and lot number. He didn't appear to be interested in further diagnosis and made sure I had the paperwork to track the results of my Covid swab sent to the lab. The visit was completed and I was released to go back to work/home. I carried on the symptoms of the shortness of breath from the 19th of January to the 22nd of January monitoring my O2 (oxygen levels) with a pulse oximeter. They ranged from 90-93. On the evening of the 22nd of January I was becoming very uncomfortable with my breathing climbing the stairs in my home and monitored my O2 readings with the oximeter on my finger when walking upstairs and they dropped down to 60-65. My wife drove me to the emergency room at Hospital. I walked into the ER and checked myself in for shortness of breath and leg pain in my right leg. I was admitted into the emergency room and put on 15 litres of oxygen. The emergency room Dr ordered a chest Xray, Cat Scan of my chest and heart and a sonogram of my right leg. The testing results came back with a noted large pulmonary emboli on my lungs/heart area and blood clots throughout my right leg (right lower extremity DVT). Surgery was performed to remove the pulmonary emboli and I was put on a Heparin Drip to thin out my blood for the remaining clots in my chest and my right leg. The attending physician ordered a T.E.E. (transesophageal Echocardiogram) to observe my heart functions. I was told the TEE did not demonstrate any further recommend surgeries. I was administered a test for

my cardio and heart functions prior to my discharge on 27 January 2021. I was prescribed Eloquis for maintenance medication to be monitored by followup visits to my cardiologist and Hemotologist within the next few weeks. I have not family or personal history of Blood Clots. I do perform administrative duties as part of my job, which requires sitting and working on a computer. Note however I move around very often during a work day and operate a farm tractor and have an active life style. I have not recently had any extended trips more than 2 hours nor have I flown within the past year or so.

Preexisting Conditions: Hashimoto's Hypothyroidism OSA

Allergies: EDD, EDTA, celebrex, ranidatine, nystatin

Diagnostic Lab Data: 1/17/21 - PCR test positive for Covid 1/26/21- PCR test positive for Covid

CDC Split Type:

Write-up: I contracted Covid-19 approx 1 week after getting the vaccine. I do not believe that the vaccine gave me Covid. But, I believe that it made me more susceptible. The week of receiving the vaccine my daily schedule was approx 80-90% covid patients. I do Physical Therapy in a hospital with them and spend approx 30 min or more with each patient. If I or my

facility would have been given a warning my schedule could have been different. Our therapy team might have been allowed to change the individual patient load depending on when each person recvd the vaccine. I am older and have a few underlying conditions so I was concerned about contracting it. Luckily I was able to stay home. *main take-away is that health care facilities should have been given more information and guidance on how to change schedules to best protect the employees if the vaccine causes a reduction in immunity right after. I asked the question in a Facebook group for therapists and many of them did get covid right away. Coincidentally? Could be. But for sure something to keep track of.

CDC Split Type:

Write-up: I received my second dose of the Moderna COVID vaccine at approx. 10:40 AM on Friday, January 29 at clinic. By 12:00 PM, I noticed that I developed facial swelling, which was most significant around my eyes, and I felt lethargic. Between 12:00 PM and 2:00 PM, I developed hives on my neck, chest, stomach, and arms, which prompted me to take 1/2 of a dose of 25mg Benadryl. Nonetheless, the symptoms persisted and I began to experience dizziness and tightness in my throat around 4-5 PM, which was when I was advised by a nurse to go to the emergency room for treatment. I arrived at Hospital's Emergency Department around 6:00 PM and I was treated for "Possible Allergic Reaction Major." I received diphenhydrAMINE (BENADRYL) injection 50 mg, famotidine (PF) (PEPCID) injection 20 mg, methylPREDNISolone sodium succinate (PF) (SOLU-MEDROL) injection 125 mg, sodium chloride 0.9 % iv bolus, and acetaminophen (TYLENOL) tablet 650 mg. I was discharged after 10:00 PM and sent home with a prescription for predniSONE 20 mg and famotidine 20 mg. My facial swelling and hives have gone down but neither have completely resolved since being discharged. I am also experiencing full body aches and fatigue at this time (3 PM on Saturday, January 30).

Additional tiny segmental left lower lobe posterior filling defect. No CT evidence for right heart strain. 2. Known right proximal humerus fracture with hemarthrosis and blood extending to the muscles of the right proximal arm, right anterior and right lateral chest wall. Echocardiogram Complete W/WO Contrast 1/28/21 Normal LV and RV size and systolic fxn, LVEF 65%. Impaired diastolic relaxation. Mild LAE. Mild TR. Inadequate tricuspid regurgitation to estimate RVSP. No pericardial effusion. Carotid Doppler 1/28/21 IMPRESSION: Mild carotid plaque LEFT greater than RIGHT. Otherwise negative exam without hemodynamically significant stenosis. ECG Sinus rhythm 1/27/21 Mild leukocytosis 1/27/21 to WBC 12 resolved through admission

CDC Split Type:

Write-up: Patient had fall x 2 with or without syncope (conflicting documentation) with humeral fracture after receiving the vaccine. Workup demonstrated PE and DVT (appears PE was not submassive/massive, unlikely it directly precipitated fall/ syncope)

Current Illness: unknown

Preexisting Conditions: diabetes obesity hypoventilation syndrome

Allergies: penicillin latex

Diagnostic Lab Data:

CDC Split Type:

Write-up: After being observed for approximately 20 minutes and patient walked to her car without assistance I was called to assess the patient in the parking lot for troubles breathing. EMS was called as I made my way outside. Upon my arrival patient was leaning out of the car and stating that she could not breath. She was able to tell me that she was allergic to penicillin. Oxygen was immediately placed on the patient with minimal relief. Lung sounds were coarse throughout. She then began to vomit about every 20-30 seconds. EpiPen was administered in the right leg with no relief. Patient continued to complain of troubles breathing and vomiting. A second EpiPen was administered in the patients right arm again with no relief. A few minutes later patient was given racemic epinephrine through the oxygen mask. There appeared to be mild improvement in her breathing as she appeared more comfortable, but still complaining of shortness of breath and vomiting. When EMS arrived patient was unable to transport herself to the stretcher. When EMS and clinical staff transferred patient to the stretcher she became unresponsive. She appeared to still be breathing. She did not respond to verbal stimuli. Per ED report large amount of fluid was suctioned from the patients lungs

following intubation in the ambulance. When patient arrived to the ED she was extubated and re-intubated without difficulty and further fluid was suctioned. At that time patient was found to be in PEA, shock was delivered. Shortly thereafter no cardiac activity was found and patient pronounced dead.

Other Medications: Warfarin, blood pressure medications (husband not sure of names), statin, over the counter fish oil, colchicine PRN, acetaminophen PRN-- might not be a complete list of medications as we do not fill for her and husband was unsure of her med

Current Illness: N/A

Preexisting Conditions: Gout, Factor V deficiency, hypertension

Allergies: Sulfa

Diagnostic Lab Data:

CDC Split Type:

Write-up: All information per patient's husband: patient started experiencing severe headache on the day of vaccination. Headache continued for three days during which no medical attention was sought. Confirmed that patient never took any NSAIDs to treat headache during this time. On day 4, patient had a subdural hematoma accompanied by two seizures upon which she was flown to a hospital to receive treatment. Husband did state that

patient is on warfarin due to factor V deficiency and that treating physician thought that this was most likely caused by the warfarin, however that the vaccine could not be ruled out completely. Husband also said INR has always been within normal limits.

CDC Split Type: USMODERNATX, INC.MOD20210

Write-up: Passed out from cardiac arrest (her head feeling really full and really hot, and felt as if she was going to pass out, then she passed out).; Passed out; fractured her face; Head really hot; Head full; Diarrhea; heart rate dropped; platelets dropped; A spontaneous report was received from a consumer concerning a 75-years-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced head feeling really full and really hot, passed out from cardiac arrest, heart rate dropped, platelets dropped, fractured her face and diarrhea. The patient's medical history was not provided. Concomitant medication included atenolol. On 13 Jan 2021, prior to the onset of the events, the patient received her first of two planned doses of mRNA-1273 (Lot number: Unknown) in her arm for prophylaxis of COVID-19 infection. On 15 Jan 2021, the patient complained her head was feeling full and hot. Felt as she was going to pass out, then she passed out from cardiac arrest and fractured her face. After passing out she got diarrhea. On 15 Jan 2021, the patient was hospitalized. The patient's heart rate decreased to 22 beats/minute three times and to 15 beats/minutes twice, and her platelet count dropped. The second dose of mRNA-1273 was discontinued in response to the events. The outcome for the events, head feeling really full and really hot, passed out from cardiac arrest, heart rate dropped, platelets dropped, fractured her face and diarrhea, and diarrhea, was unknown.; Reporter's Comments: This spontaneous report concerning a 75-year-old, female subject who experienced unexpected events of passed out from cardiac arrest and fractured her face, head feeling really full and really hot, and felt as if she was going to pass out, then she passed out, and got diarrhea, heart rate dropped down to 22, platelets also dropped, after the first dose of the Vaccine (mRNA-1273) (Lot number: unknown, expiration date: unknown). The events developed 2 days after vaccine administration. The patient was hospitalized. Treatment and outcome are unknown." Based on the information which includes a temporal association and the absence of any other etiology, a causal association cannot be excluded. However, there is inadequate information in that the patient's medical history is lacking and event is also confounded by patient's advanced age.

The cough increased; my throat swollen; hard to breath; This is a spontaneous report from a contactable other hcp (patient). A 36-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number: EI9261) at left arm via an unspecified route of administration on 22Jan2021 15:00 at single dose for COVID-19 immunization. Medical history included known allergies: Apple, pear, peach, pineapple, mango, avocado and almonds. Concomitant medications included unspecified multivitamins. No other vaccine in four weeks. After patient had the bnt162b2, with 15 minutes she started

having a small cough on 22Jan2021 15:15. The cough increased, her throat swollen and hard to breath on 22Jan2021 15:15. The nurse immediately gave her the epi pen and Benadryl. She had to rush to the ER. When she got there, she needed to have the second round of epi pen and more Benadryl. Events resulted in life threatening illness (immediate risk of death from the event). No covid prior vaccination. The patient was not pregnant at time of vaccination. The patient underwent lab tests and procedures, which included Nasal Swab on 25Jan2021 with result of negative. The outcome of the events was recovering.; Sender's Comments: Based on temporal association, a possible contributory role of BNT162B2 cannot be excluded for reported events cough, throat swelling and difficulty breathing. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

CDC Split Type: USPFIZER INC2021071845

Write-up: Anaphylactic reaction; Throat was swollen shut, couldn't talk or breathe; Throat was swollen shut, couldn't talk or breathe; Throat was swollen shut, couldn't talk or breathe; loss of consciousness; brain fog; headache; fever; severe body aches and joint aches that make movement difficult; severe body aches and joint aches that make movement difficult; severe body aches and joint aches that make movement difficult; persistent chest pain/pressure; low blood pressure; some swollen and tender bilateral lymph nodes in my neck/trapezius/left (injection site) axillary region; fatigue; decreased appetite due to nausea; decreased appetite due to nausea; This is a spontaneous report from a contactable healthcare professional. A 19-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration at the left arm on 25Jan2021 08:45 at a single dose for COVID-19 immunization at a hospital. Medical history included type 1 diabetes mellitus, Celiac disease, COVID-19, and heartburn. Concomitant medication included insulin lispro (HUMALOG), spironolactone, fluvoxamine, and alprazolam (XANAX XR). The patient previously took gluten, magnesium, and iodine and experienced allergies. On 25Jan2021 09:00, patient had an anaphylactic reaction. Throat was swollen shut, couldn't talk or breathe, loss of consciousness, brain fog, headache, fever, severe body aches and joint aches that make movement difficult, persistent chest pain/pressure, low blood pressure, and some swollen and tender bilateral lymph nodes in my neck/trapezius/left (injection site) axillary region, fatigue, and decreased appetite due to nausea. Patient had a doctor or healthcare professional visit, went to emergency room/department or urgent care, and was considered life threatening illness (immediate risk of

death from the event). Events was treated with epinephrine, diphenhydramine (BENADRYL), paracetamol (TYLENOL) and had oxygen. Patient was not tested post vaccination. The patient is not pregnant. The patient has not recovered from the events.; Sender"s Comments: There is a plausible time relationship between vaccine administration and onset of the events in a subject with allergic diathesis. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Write-up: cardiac arrest; This is a spontaneous report from a contactable consumer. An elderly (older than 65-years-old) male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot number unknown), via an unspecified route of administration on 20Jan2021 as the second single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. He was reported as with unspecified health issues, and no known allergies. The patient previously received BNT162B2 for immunization, on an unspecified date. The patient experienced cardiac arrest on 23Jan2021, at 20:30, which was serious as it was life-threatening and involved hospitalization (in the intensive care unit (ICU)). Details were as follows: after the patient received the 2nd dose of the vaccine on 20Jan2021. The reporter indicated that he was released to go on 23Jan2021. The patient went into cardiac arrest. Therapeutic measures were taken as a result of cardiac arrest. The patient was reported as in the ICU, and critical on life support. There was no note of COVID prior to vaccination. It was unknown if the patient has had a COVID tested post vaccination. The outcome of cardiac arrest was not recovered. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up.

Write-up: My mom who is 75 had an adverse reaction on from the COVID vaccine she took on Jan 15, 2021. She went to bed at night and woke up at 4 AM with a severe headache. She took Aleve and went back to bed. When she woke up at 8:30 AM her headache was very severe and was accompanied with very severe chest pain. I immediately took her to the ER. They did a very thorough work up to check on her heart and Aorta. They managed her severe pain with two doses of morphine followed by two days of Dilaudid. The imaging and symptoms left her with a newly discovered diagnosis of Pericarditis. The medical professions were sure this was a result of the COVID vaccine. They continued to treat her for a few days and sent her home with anti inflammatories to help. She continues to have muscle pain, weakness and shortness of breath when she walks. She is scheduled to take her 2nd dose on February 5th but we are very concerned and hesitant as we don't want to cause any more damage to her heart. Please have somebody contact us and let us know how to proceed. Thanks.

Diagnostic Lab Data: 1/28/2021---CT Scan of chest and D-Dimer test

CDC Split Type:

Write-up: On 1/28/2021 at 0545 hours as I was on my way into work when I started to have severe right side chest pain, so much so that I had to pull over. Shortly thereafter ambulance arrived on scene at which time it was determined that I would be transported to the hospital. Once there, a series of tests were conducted, one of which was a D-Dimer blood test to rule out blood clots. That resulted in an elevated count to which a CT scan was ordered. The result of the CT scan revealed that I had 2 Pulmonary Embolisms, one in the upper lobe of my right lung and one in the middle lobe of my right lung. Due to me being what the doctors said was a healthy 45 year old with no underlying conditions or signs of DVT (deep vein thrombosis) they deemed me low risk at that time and advised I was at low risk of dying in the next 30days. However, they advised that at any time, the clot could possibly become dislodged and cause worse problems, possibly death if time is not given to the body to dissolve the clots. Ultimately it was determined that I be discharged and prescribed blood thinning medications to help thin the blood to prevent further clotting should I have a clotting issue (undetermined at this time).

Diagnostic Lab Data:

CDC Split Type: USPFIZER INC2021071865

Write-up: Delusional and confrontational; Unable to take meds or eat; Seemed to be having a mental breakdown; Constantly obsessing over minutia that was not pertinent to what she is being asked to do; She gets very upset and anxious and angry; This is a spontaneous report from a contactable nurse. An 87-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number/expiration date not reported), intramuscular (left arm) on 15Jan2021 13:30 at a single dose for COVID-19 immunization. Medical history included depression, cerebrovascular accident (CVA), chronic heart failure (CHF), emphysema, and angina, all from unknown dates and unknown if ongoing. Concomitant medication included furosemide (LASIX), amlodipine, losartan, sertraline, nortriptyline, methazolamide, quetiapine fumarate (SEROQUEL), dorzolamide, tiotropium bromide (SPIRIVA), ciclesonide (ALVESCO), albuterol (ALBUTEROL [SALBUTAMOL]), carvedilol, calcium magnesium, iron, curcuma longa (TURMERIC), clarithromycin (CLARITIN), magnesium citrate, cyanocobalamin (B 12), paracetamol (TYLENOL), estradiol (ESTRACE) , d-mannose, vitamin D3. Concomitant medication also includes multivitamin, and stool softeners. It was reported that on 15Jan2021 at 15:30 the patient became delusional and confrontational and unable to take meds or eat. The patient seemed to be having a mental breakdown. No physician (MD) in ER would address the issue. It happened approximately two hours after the vaccine. She will not eat or take meds; she is constantly obsessing over minutia that was not pertinent to what she is being asked to do. For example, she comes up with steps she needs to take before she can eat, but she doesn't know them, so she gets very upset and anxious and angry. The events were assessed as life-threatening. The outcome of the events was unknown. Information on the Batch/Lot number has been requested.; Sender's Comments: A possible contributory role of the suspect products cannot be excluded for the reported events based on the known safety profile and temporal association. However high age of the patient and underlying medical conditions cannot be ruled out a contributory factors The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators as appropriate.

Diagnostic Lab Data: Test Name: Heart Rate; Result Unstructured Data: 20 heart beats per minute

CDC Split Type: USMODERNATX, INC.MOD20210

Write-up: Passed out; Low heart rate; Possible pneumonia; A spontaneous report was received from a consumer concerning an 84-year-old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced passed out, low heart rate, and possible pneumonia. The patient's medical history was not reported. There were no concomitant medications provided. On 15 Jan 2021, the patient received the first of two planned doses of mRNA-1273 (Lot # unknown) intramuscularly, for prophylaxis of COVID-19 infection. On 17 Jan 2021, the patient was hospitalized for passed out, low heart rate, and possible pneumonia. The reporter's mom found the patient passed out on the floor. It was thought he may have passed out about 4 or 5pm. The patient was taken to the emergency room (ER) via ambulance. At that time his heart rate was 20 bpm. Physicians said he may have pneumonia. It was noted the patient still works and walks miles every day. The patient was still hospitalized at the time of this report. There was no treatment information provided. Action taken with mRNA-1273 in response to the event was not provided. The outcome for the events of passed out, low heart rate, and possible pneumonia was unknown at the time of this report.; Reporter's Comments: This case concerns a 84 year old male patient who experienced a serious unexpected events of passed out, low heart rate, and possible pneumonia. The event occurred 2 days 7 hours after first dose of the vaccine. Very limited information regarding the events has been provided at this time. Based on temporal association between the use of the product and the start date of the event/s, a causal relationship cannot be excluded.

Previous Vaccinations:

Other Medications: 1200 mg calcium with vitamin D

Current Illness: none

Preexisting Conditions: none

Allergies: None

Diagnostic Lab Data: In emergency department Thursday (1/28) evening from 1800 to approximately 2300, patient had blood work including CBC, CMP, lactic acid, d-dimer, CK, ammonia, blood cultures, urinalysis, COVID swab, Respiratory virus panel swab, lumbar puncture, CT of head, CT abdomen, CTA chest, chest x-ray performed. Abnormal results: D-dimer resulted slightly elevated at 0.55 (normal high range 0.50). CSF testing included

meningitis/encephalitis panel, cell count, glucose, and culture. Protein in CSF and WBC (60) were slightly elevated. All other results came back negative and were within normal limits including blood cultures, urine culture, and CSF culture. All radiologic tests were negative. A repeat panel for HSV meningitis on CSF is still pending results on 2/2. On Friday (1/28), she had a head MRI (negative) and an EEG (negative). Infectious disease physician added further testing (afternoon of 1/28) on CSF including HIV, RPR, west nile virus, cryptococcal, and legionella (all negative) and pulmonologist added UDS and cortisol levels (negative and WNL). Once she started having diarrhea, she had a stool study completed on (2/1) which was negative for pathogens. Each morning from 1/29-2/2 she had CBC and CMP drawn which remained normal throughout stay.

CDC Split Type:

Write-up: Patient felt unwell and had a fever on Wednesday (1/27) and went home early from work. On Thursday morning (1/28), she threw up once and then laid down to rest. Her son reported seeing her that morning with the episode of emesis prior to her getting on the couch. Son reports that when he came home at 5pm, she was asleep on the couch. Teenage daughter reports patient had been asleep on couch all day. Son tried to wake patient up and she was disoriented and lethargic. Daughter (reporter) was contacted to come see patient and on arrival to house (5:45pm), noted patient was confused, lethargic, febrile (104), and hypoxic at 83% on room air with portable pulse oximeter. Patient was able to stand and ambulate to car with assistance and was driven to Emergency Department for evaluation. At emergency department, patient was hypotensive 80/40s but was able to increase blood pressure with 3 L of normal saline to blood pressure of 90/50s. See all tests performed and results below. Patient received antibiotics, anti-virals and tylenol for fever of 102.7 while in emergency department. She was admitted to ICU that evening at approximately 11pm and had a foley catheter placed overnight due to decreased urine output. patient continued to have low blood pressure through morning of 1/28 and was placed on levophed for blood pressure control at approx 10 am. Her blood pressures continued to improve through afternoon and levophed was titrated down and then discontinued around 4pm. She continued to received antibiotics for 24 hours after initiation and continued acyclovir during course of hospitalization and is still receiving doses on 2/2. Patient's initial mental status was confused, lethargic, and unable to communicate. She was intermittently oriented to herself only and would not follow commands. She would localize painful stimuli. Her mental status began to improve on Saturday when she started to become more awake but was still unable to follow commands or communicate clearly. She was moved from ICU to IMCU (step down unit) on Saturday once mental status was improving and blood pressure was stabilized. Her mental status continued to improve from Saturday 1/30 to Tuesday 2/2 (current). She began to have diarrhea on Saturday afternoon that continued through Monday and occurred every 1-2 hours. She was unable to stand or move body on her own and had to be assisted by staff to be cleaned. She remained awake and alert and was able to get up and walk on Monday and began to eat. She continued acyclovir treatment pending HSV meningitis panel PCR results (still pending currently 2/2). Mental status not currently at baseline but continuing to improve. She is also still experiencing generalized weakness. Hospitalist team and infectious disease doctors report she should be discharged tomorrow (2/3). No source for confusion and hypotension has been found at this time. Physician team think HSV is unlikely but awaiting final diagnosis until test is resulted.

Other Medications: Prednisone 40 mg po, Benadryl 25 mg PO, Pepcid 20 mg, Symbicort and Qvar. PRN "Triptan" for migraines

Current Illness: 1/14- hypokalemia, asthma exacerbation,

Preexisting Conditions: Asthma, Migraine, Heart murmur Mitral and Pulmonary, IBS

Allergies: None.

Diagnostic Lab Data: None

CDC Split Type:

Write-up: Pt. with known allergic type reaction after first dose of vaccine, discussed getting the 2nd vaccine by intensivist and pulmonologist and was advised to go ahead and get second vaccine. 1st vaccine Reaction: Itchiness of entire body, fatigue, tongue "felt funny," stomach cramping. She was premedicated with Prednisone 40 mg po, Benadryl 25 mg po, Pepcid 20 mg morning of vaccine. Pt. was administered vaccine at 12:15 am and at 12:40, she started to have tongue and throat itching, swelling, voice change, H/A and abd. pain. Medical first response was called and Dr. (Anesthesia) and FNP was present on-site at 12:41 Epi 0.3 mg sq was given. Additional 50 mg IM of Benadryl was also administered. Pt. was transported to ED via wheelchair and found to have angioedema and dx of anaphylaxis. Pt. was administered Benadryl IV, Pepcid IV, Solu-Medrol IV, Epi IV was administered in the ED due to persistent angioedema. She was discharge home same day at 16:03 and asked to f/u with PCP in 1-3 days. 2/2/21- Still on prednisone, pepcid and Zrytec. Tongue still feels itchy and a little swollen, but overall feeling well.

Diagnostic Lab Data: none

CDC Split Type:

Write-up: Patient with a subjective complaint after first covid vaccine where patient felt a hot flushed feeling across chest and throat and face of which patient did not self medicate nor seek treatment. Patient was given Benadryl 25mg IM pre vaccination at 12:39pm, vaccine given at 1:00pm and while being observed by vaccination team, patient become diaphoretic, pale, "throat tightness" that was appreciated to be swollen, and difficulty swallowing at 1:11pm at which point Epinephrine 0.3mg was given IM to L anterior thigh. Patient's vitals were the following: BP 148/86, HR 124 bpm. After epinephrine, patient's throat swelling and breathing much improved, and able to swallow. Patient was then transported to ED in wheelchair via wheelchair. Patient was given Dexamethasone 10mg IV, Pepcid 20mg IV, and Benadryl 25mg IV. Only complaint that patient had during ED visit was palpitations of which HR did regulate to 86 bpm, BP 149/70. Patient was discharged on 1/29/2021 at around 4:50pm as patient was fully asymptomatic and able to ambulate on own. Sent home with prednisone 40mg po daily x 7 days, pepcid and benadryl etc. Advised to f/u with PCP in 1-2 days and suggested possible allergy testing.

Previous Vaccinations:

Other Medications: diuretic (high bp medication); liquid morphine for arthritis pain; CIPRO antibiotic for cystitis

Current Illness: urinary infection (recent--one week);

Preexisting Conditions: osteoarthritis; osteoporosis; acid reflux; joint pain

Allergies: none

Diagnostic Lab Data: Emergency transport by ambulance to Hospital, where she was diagnosed with a broken hip and is scheduled for surgery on 2/3/21.

CDC Split Type:

Write-up: My mother fainted on the night she was vaccinated, early in the morning. She had gone to the kitchen to get a heating pad and felt faint while standing. She didn't make it to a chair, but fell and broke her hip. While this could have been due to another health problem, my mother had never had a fall or a near-fall. It is concerning that very old adults are not warned to have someone with them after receiving the vaccine (for instance, overnight), I realize that the vaccine has not been studied specifically in geriatric populations, but it is realistic to assume that there are substantial numbers of very old people living on their own, particularly in cities where there is no need to drive, and where food and other necessities can be delivered. There should be a warning to people that they should not be alone after receiving the vaccine.

CDC Split Type:

Write-up: On 1/14/2021 (about 14 days from dose # 1) Tachycardia of unknown origin, 120 BPM for 6 hours, Called Cardiologist and was seen @ MD next business day, and given EKG and Bystolic 10 MG to "add" to daily regimin IF it returned. It retuned to normal after 6 hours, and then occurred again 1 week later...for 6 hours. I took Bystolic, and about 8 hours later it returned to baseline (about 62/min. on Sun 1/24/2021, I woke up to bloody diarrhea x several episodes...this continued until Wed 27th, at which time my son (a 4th year graduating MD student) drove me to hospital and I was seen in ER room by MD. I was admitted, and had emergency surgery 1/27/2021 straight from Er Room. I had life saving surgery the next day to stop a lower GI bleed (of unknown origin). I was discharged 3 days later, and I am awaiting more testes, appts, etc.... I have lost time, money, and work from this near death experience... and the tachycardia still needs to be followed up on . I am EXTREMELY upset by these events, as I almost died....was hospitalized, incurred a lot of expense, used up all my sick pay and personal days, and out-of -pocket to my healthcare insurer.

A 73-year-old female patient received the 1st dose of bnt162b2 (BNT162B2) at single dose intramuscular on 03Jan2021 for Covid-19 immunisation, administered at nursing home/senior living facility. Medical history included alcohol use, diverticulitis, iron deficiency anaemia (IDA), asthma, hypertension, anxiety, recent C. diff infection, allergies to penicillin. She was not pregnant. The patient had not experienced Covid-19 prior vaccination. Concomitant

medication included apixaban (APIXABAN), bioflavonoids nos, calcium ascorbate, hesperidin, rutoside, sodium ascorbate, zinc amino acid chelate (VITAMIN C [BIOFLAVONOIDS NOS;CALCIUM ASCORBATE;HESPERIDIN;RUTOSIDE;SODIUM ASCORBATE;ZINC AMINO ACID CHELATE]), cyanocobalamin (B-12), furosemide (LASIX), simethicone (manufacturer unknown), tramadol (manufacturer unknown), vancomycin (manufacturer unknown) oral, omeprazole (PROTONIX), amlodipine (manufacturer unknown), vitamins nos (MULTIVITAMIN), thiamine (manufacturer unknown), aripiprazole (ABILIFY), atorvastatin calcium (LIPITOR), clonazepam (KLONOPIN), folic acid (manufacturer unknown), sertraline hydrochloride (ZOLOFT). The patient had not received any other vaccines within 4 weeks prior to the BNT162B2 vaccine. On 10Jan2021, 7 days after getting vaccine, the patient developed shortness of breath and fatigue, rheumatoid arthritis, O2 sat 70% on RA, now intubated and in multiorgan failure. The events resulted in Emergency room/department or urgent care, hospitalization, life threatening illness for immediate risk of death from the event. The patient was hospitalized for the events for 18 days. Patient received treatment with corticosteroids, antibiotics, antifungals, dialysis, mechanical ventilation, inhaled Epoprostinol. The patient underwent lab tests and procedures which included SARS-CoV-2 test: unknown in Jan2021. Pre / post vaccination, the patient has been tested for COVID-19 with unknown result. The with outcome of events was not recovered.; Sender's Comments: Based on the temporal gap between the vaccination and the event onset, the Company considered that there was not a reasonable possibility that the events were related to suspect vaccine BNT162B2. The patient's advanced age, underlying medical conditions and multiple concomitant medications could be contributory to the events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Write-up: Positive Covid case investigation with the PA DOH. Spoke with case's daughter. States her mother received vaccine at clinic on 01/27/21. Had no complaints of illness or exposure to a positive case prior to vaccine. Daughter states she's independent and stays alone at night. Felt fine the day and the day after of the vaccine. Per daughter, case's last known well time was Friday 1/29/21 at 730pm. Daughter states they found her Saturday morning with stroke like symptoms and was admitted to Hospital step down unit. She was also informed by the doctor that her heart was irregular with atrial fibrillation.

Write-up: Narrative: Patient received Moderna COVID-19 vaccine via drive thru clinic. The patient was in his vehicle with his wife, when he became diaphoretic and passed out for a couple minutes. Rapid response was called. Patient was removed from the vehicle. He was becoming obtunded and was placed on the pavement. 911 was called. He was given EpiPen at 10:41. His vital signs at 1042 were: saturation 98% on room air, pulse 59, blood pressure 138/80. Patient received Solu-Medrol 125 mg IM a couple of minutes after EpiPen. After the EpiPen the patient became more alert, denied shortness of breath or wheezing, he was nauseated without vomiting. His saturation at that point dropped to 88% on room air, he was started on oxygen with nonrebreather mask. Rescue truck arrived at approximately 1047, and the patient was taken to emergency room. Discharged same day.

Write-up: Pt. presented for her second dose of Covid vaccine and denied having reaction to her first dose. Pt. was vaccinated at 7:22 am and was checked on at 7:45 am, when she indicated a tightness in her chest and throat. First response was called and at 7:48 Benadryl 25mg IM was given and at 7:50 a dose of epi 0.3 sq was provided and pt. was transferred to the ED by Wheelchair. Presented in ED essentially asymptomatic by time she arrived to ED per ED physician. She was given 10 mg Dexamethasone 10 mg IV, Benadryl 50 mg IV, Famotidine 20 Mg IV in the ED. Pt. discharged from ED at 10:42 am the same day. After discharge on 1/29/2021, the patient continued to have symptoms. On 2/2/21 12:44 pm called Covid Medical Command c/o 8/10 mid sternal CP radiating to her back. Also complaining of chest heaviness, advised by Dr. to seek care at the ED. Pt. arrived at the ED at 13:02 and was being worked up for chest pain worsening when taking deep breaths. The pain started yesterday and was worsened at work. Also c/o felling fatigue and chills. Pt. given keteolorac 30mg and Lidocaine patch. Additional pain medication of morphine was given. Worked up for PE with CT of chest. R/O ACS in the ED. CP was found to be reproducible and she was diagnosed with chest wall pain. Still has chest discomfort 2/3/21, but feels able to return to work.

Other Medications: acetaminophen diclofenac gel docusate sodium melatonin polyethylene glycol tramadol

Current Illness: Resident fell and fractured her pelvis in the week prior to vaccination

Preexisting Conditions: Alzheimer's dementia hypothyroidism insomnia Osteoarthritis of right knee

Allergies: amitriptyline codeine tetanus vaccine doxepin erythromycin

Diagnostic Lab Data: CT brain CT cervical spine CXR xray pelvis

CDC Split Type:

Write-up: On 1/15/21, resident fell during the night while getting up without assistance and hit her head. She did not have any neurological impairment after fall and remained at facility to be monitored. 1/26/21, resident had sudden loss of consciousness with hypotension and tachycardia. This resolved slowly after resident was put in trendelenberg position. She has not had similar events in the past. She was sent to ED without a distinct underlying cause of the event identified, differential included cardiac arrhythmia, ? orthostatic hypotension, vasovagal syncope, stroke She had a similar event occur on 1/27 after she had returned to the facility from the ED. The family elected not to pursue further evaluation for second event and she was placed on hospice as she had been experiencing some gradual decline before these events occurred.
